## Synthesis of [2]Rotaxane **R1•4PF<sub>6</sub>** and its Precursor Dumbbell-Shaped Compound **D2**

The routes employed to synthesize the [2]rotaxane **R1•4PF<sub>6</sub>** and its respective dumbbell-shaped compound **D2**, are outlined in Schemes S1–S2. The aldehyde **5** (Scheme S1) was obtained in 81% yield by reacting 4-hydroxy-3,5-diisopropyl-benzaldehyde<sup>[1]</sup> (**3**) with 2-(2-chloroethoxy)ethanol (**4**) under alkylation conditions (K<sub>2</sub>CO<sub>3</sub>/KI/DMF) at 100 °C. Treating **5** with TsCl in the presence of Et<sub>3</sub>N and DMAP in CH<sub>2</sub>Cl<sub>2</sub> solution gave the tosylate **6** which was then reacted, without purification, with NaBH<sub>4</sub> in MeOH, to afford the benzyl alcohol **7** in an overall yield of 67%. Alkylation (K<sub>2</sub>CO<sub>3</sub>/LiBr/18C6/MeCN) of 1-acetoxy-5-hydroxy-naphthalene<sup>[2]</sup> (**8**) with **5** produced the intermediate ester **9**, which was subjected to saponification (KOH/MeOH) to yield the diol **10** (overall 72%). Preparation of the [2]rotaxane **R1•4PF<sub>6</sub>** (Scheme S2) was completed by alkylating **10** with the tosylate<sup>[4]</sup> **11** in MeCN in the presence of K<sub>2</sub>CO<sub>3</sub>, LiBr, and 18C6 to afford the dumbbell-shaped compound **D2** in 68% yield. The template-directed synthesis of the [2]rotaxane **R1•4PF<sub>6</sub>** was accomplished by reacting **D2**, the dicationic salt<sup>[3]</sup> **12•2PF<sub>6</sub>**, and 1,4-bis(bromomethyl)benzene (**13**) in DMF at RT for 10 d. The [2]rotaxane **R1•4PF<sub>6</sub>** was isolated after addition of H<sub>2</sub>O in 85% yield as an analytically pure green solid after chromatography on silica gel using a 1 % NH<sub>4</sub>PF<sub>6</sub> solution in Me<sub>2</sub>CO as the eluent.

## Experimental Section

**General Methods:** Chemicals were purchased from Aldrich and used as received. The compounds 4-hydroxy-3,5-diisopropyl-benzaldehyde<sup>[1]</sup> (**1**), 1-acetoxy-5-hydroxynaphthalene<sup>[2]</sup> (**6**),  $\alpha,\alpha'$ -[1,4-phenylenebis (methylene)]bis(4,4'-bipyridium) bis(hexafluorophosphate)<sup>[3]</sup> (**12•2PF<sub>6</sub>**), and the tosylate<sup>[4]</sup> **9** were all prepared according to literature procedures. Solvents were dried following methods described in the literature.<sup>[5]</sup> All reactions were carried out under an anhydrous argon atmosphere. Thin layer chromatography (TLC) was performed on aluminum sheets coated with silica-gel 60F (Merck 5554). The plates were inspected by UV light and, if required, developed in I<sub>2</sub> vapor. Column chromatography was carried out by using silica-gel 60 (Merck 9385, 230-400 mesh). Melting points were determined on an Electrothermal 9100 melting point apparatus and are uncorrected. All <sup>1</sup>H and <sup>13</sup>C NMR spectra were recorded on either (i) a Bruker ARX500 (500 MHz and 125 MHz, respectively) or (ii) a Bruker Avance500 (500 MHz and 125 MHz, respectively), using residual solvent as

the internal standard. Samples were prepared using  $\text{CDCl}_3$ ,  $\text{CD}_3\text{COCD}_3$  or  $\text{CD}_3\text{CN}$  purchased from Cambridge Isotope Labs. All chemical shifts are quoted using the  $\delta$  scale, and all coupling constants ( $J$ ) are expressed in Hertz (Hz). Fast atom bombardment (FAB) mass spectra were obtained using a ZAB-SE mass spectrometer, equipped with a krypton primary atom beam, utilizing a *m*-nitrobenzyl alcohol matrix. Cesium iodide or poly(ethylene glycol) were employed as reference compounds. Electrospray mass spectra (ESMS) were measured on a VG ProSpec triple focusing mass spectrometer with MeCN as the mobile phase. Microanalyses were performed by Quantitative Technologies, Inc.

**Alcohol 5.** A solution of 4-hydroxy-3,5-diisopropylbenzaldehyde (**3**) (2.06 g, 10 mmol), 2-(2-chloroethoxy)ethanol (**4**) (1.31 g, 11 mol),  $\text{K}_2\text{CO}_3$  (2.76 g, 20 mol) and KI (20 mg) in DMF was stirred at  $100^\circ\text{C}$  for 16 h.
