## 1 General Information

Reagents and solvents for Mukaiyama-aldo/[1,5] hydride shift cascade reaction were purified prior to use by the following procedures:

TiCl<sub>4</sub> solution (1.0 M in CH<sub>2</sub>Cl<sub>2</sub>) was purchased from Sigma-Aldrich and used as obtained.

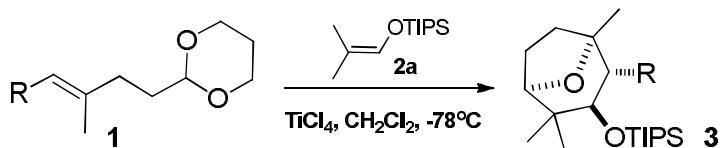

CH<sub>2</sub>Cl<sub>2</sub> (Reagent grade, Merck) was distilled from CaH<sub>2</sub>.

4Å molecular sieves were purchased from Alfa Aesar and activated at 250 °C for 10 hours prior to use.

Analytical thin layer chromatography (TLC) was performed using Merck 60 F254 precoated silica gel plate (0.2 mm thickness). Subsequent to elution, plates were visualized using UV radiation (254 nm) on Spectroline Model ENF-24061/F 254 nm. Further visualization was possible by staining with basic solution of potassium permanganate or acidic solution of ceric molybdate, followed by heating on a hot plate. Flash chromatography was performed using Merck silica gel 60 with distilled solvents. Columns were typically packed as slurry and equilibrated with hexane prior to use.

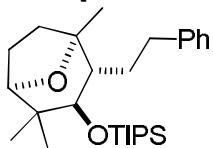

Proton nuclear magnetic resonance (<sup>1</sup>H NMR) and carbon nuclear magnetic resonance (<sup>13</sup>C NMR) spectroscopy were performed on Bruker Advance 300, 400 and 500 NMR spectrometers. Chemical shifts of <sup>1</sup>H NMR spectra are reported as *d* in units of parts per million (ppm) downfield from SiMe<sub>4</sub> (*d* = 0.0) and relative to the signal of chloroform-*d* (*d* = 7.264, singlet). Multiplicities were given as: s (singlet); d (doublet); t (triplet); q (quartet); dd (doublet of doublets); ddd (doublet of doublets of doublets); m (multiplets) and etc. The number of protons for a given resonance is indicated by *nH*. Coupling constants are reported as *J* values in Hz. Carbon nuclear magnetic resonance spectra (<sup>13</sup>C NMR) are reported as *d* in units of parts per million (ppm) downfield from SiMe<sub>4</sub> (*d* 0.0) and relative to the signal of chloroform-*d* (*d* = 77.23, triplet). Infrared spectra were recorded on a Shimadzu IR Prestige-21 FT-IR Spectrometer. Liquid samples were examined as film between NaCl salt plates. High-resolution mass spectral analysis (HRMS) was performed on Q-ToF Premier mass spectrometer (Waters Corporation).

## 2 General Procedure for Cationic Cascade Reaction to Construct 8-Oxabicyclo[3.2.1]octanes

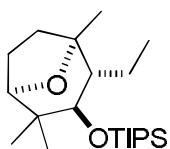

An oven-dried round bottom flask (10 mL) equipped with a magnetic stir bar was charged with 4Å molecular sieves (300 mg), and sealed with a rubber septum. Then acetal (0.20 mmol) and silyl enol ether (0.3 mmol, 1.5 equiv) were dissolved in dry CH<sub>2</sub>Cl<sub>2</sub> (2 mL) and added via syringe. After cooling the solution to -78 °C, TiCl<sub>4</sub> (0.24 mL of a 1.0 M solution in CH<sub>2</sub>Cl<sub>2</sub>, 0.24 mmol, 1.2 equiv) was added dropwisely. The solution was allowed to stir at -78 °C for 10 h and then quenched with sat. NaHCO<sub>3</sub> (5 mL), and extracted with EtOAc (3 x 20 mL). The combined organic layers were washed with brine (30 mL), dried over Na<sub>2</sub>SO<sub>4</sub>, and concentrated *in vacuo*. The crude product was purified by flash column chromatography on silica gel using appropriate solvents (hexane/diethyl ether mixture) to provide the title compound.

## 4 Experimental Data for Reaction Precursors

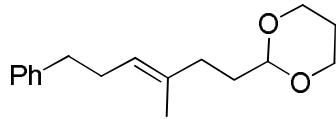

To a solution of corresponding aldehyde (30 mmol) in THF (30 mL) was added 2-propenylmagnesium bromide (1.0 M in THF, 45 mL) dropwise at 0 °C. The mixture was stirred at room temperature for 30 mins, followed by quenching with saturated NH<sub>4</sub>Cl solution (50 mL). The ultimate reaction mixture was extracted with Et<sub>2</sub>O (2 × 100 mL), washed with brine (100 mL), dried over anhydrous MgSO<sub>4</sub>, concentrated *in vacuo* provided the allylic alcohols as colorless oil.

A solution of the allylic alcohol (30 mmol) and propanoic acid (1 mL) in triethyl orthoacetate (50 mL) was heated at 145 °C for 2 hours and ethanol was then distilled out. The reaction was cooled to room temperature and washed with saturated NaHCO<sub>3</sub> solution (100 mL) and brine (100 mL). The organic layer was dried over MgSO<sub>4</sub> and concentrated *in vacuo* to yield the ester as colourless oil in 85-96% yields.

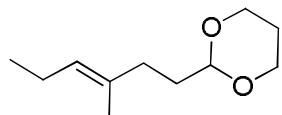

To a solution of the above prepared esters (10 mmol) in 25 mL dry dichloromethane was added DIBAL-H (1 M in heptane, 12 mL, 1.2 equiv) dropwise at -78 °C. The mixture was stirred at that temperature for 2.5 h, then quenched by adding MeOH (5 mL) and saturated aqueous solution of Rochelle's salt (15 mL). The resulting mixture was stirred vigorously until two clear layers were obtained (about 2 h) at room temperature. The two layers were separated and the aqueous layer was extracted with Et<sub>2</sub>O (3 × 20 mL). The combined organic layers were washed with brine (40 mL), dried over MgSO<sub>4</sub>, filtered, and concentrated *in vacuo* to obtain crude aldehydes. Flash column chromatography with hexane/EA as the eluent afforded the desired products as colorless oil in 75-86% yields.

To a solution of aldehyde (2 mmol), TsOH (0.10 equiv) and 1,3-propanediol in 15 mL toluene was added triethylorthoformate (6 mmol, 3.0 equiv) at 0 °C. The reaction mixture was stirred for 12 h at room temperature. The reaction was then quenched with triethyl amine (0.5 mL) and concentrated *in vacuo*. The crude product was purified by flash column chromatography with hexane/EA as the eluent provided the desired products as colorless oil in 78-93% yields.

General procedure for chiral acetals synthesis

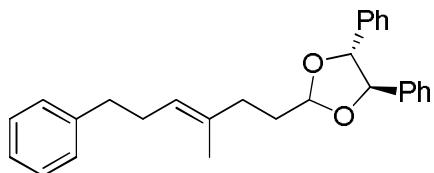

To a solution of corresponding achiral acetal (1 mmol) in DCM (5 mL) was added chiral diol (1.2 mmol, 1.2 equiv) and TsOH (0.1 mmol) at room temperature. The mixture was stirred at room temperature for 5 h, followed by quenching with triethyl amine (0.1 mL). The reaction mixture concentrated in *vacuo* and purified by chromatography with hexane/EA as the eluent provided the desired products as colorless oil in 85-94% yields.
