Foreword

About 300 million people of sub-Saharan Africa (SSA) depend on maize as a staple food. During the last three decades, there have been tremendous strides in increasing maize production and productivity in the region due to the development of early, extra-early, intermediate-, and late-maturing maize varieties with improved resistance to *Striga hermonthica*, the maize streak virus (MSV), downy mildew, and stem borers along with tolerance to drought for the forest, forest–savanna transition, and savanna agroecological zones. Reviewed in this book are the breeding methodologies and strategies that have been adopted for the improvement of the early and extra-early varieties that have largely contributed to the phenomenal increases in maize production and productivity in the savannas, especially the northern fringes of the Guinea savanna and the Sudan savannas.

Even though there are many books on the principles and practices of maize breeding and improvement, the major focus of these books has been on temperate maize. This book focuses on the principles and practices of maize improvement of tropical maize with special emphasis on early and extra-early maize. This book should therefore be of great interest to maize breeders, graduate students, and professors of maize breeding interested in the genetic enhancement of maize to feed the increasing population of sub-Saharan Africa. The book should also be useful to national agricultural research and extension systems, nongovernmental organizations (NGOs), seed companies, community-based seed organizations, and policy-makers interested in generating wealth from agriculture and providing agricultural solutions to alleviate hunger and poverty in the sub-region.

The material in this book is based on the wealth of knowledge accumulated during the last three decades in breeding early and extra-early maize for tolerance/resistance to biotic and abiotic stresses in SSA and the experience gained over the years in offering training courses in maize improvement and seed production to young scientists and technicians of the sub-region. Thus, this book on maize improvement is unique to the extent that it is based on the practical experience and realities in SSA and is also relevant to the situation and circumstances of the maize breeders and farmers of the sub-region.

Director General, IITA, Ibadan, Nigeria

N. Sanginga

Preface

Maize production in SSA has been greatly constrained by many biotic and abiotic stresses. Most of these constraints cut across countries with similar agroecological zones, the most important being drought, low soil fertility, *Striga* infestation, stem borers, and maize streak virus (MSV). The last two are more important in the more humid southern zones. In addition, farmers face a variety of policy and institutional constraints, such as undeveloped markets, the high cost of farm inputs, high labor requirements for land preparation and weeding, lack of good-quality seed, and difficult access to credit, all of which inhibit increases in maize yields and production. Improved maize varieties grown under controlled and well-managed conditions on research stations can produce average yields of 4–5 t/ha in the forest zone and 5–8 t/ha in the savanna zones, but the average yield in the farmers' fields is currently about 1.5 t/ha, one of the lowest in the developing world. National maize scientists of West and Central Africa (WCA), in collaboration with farmers, identified, in 1998, maize production constraints as the need for improved crop varieties, appropriate natural resource and crop management, plant health, postharvest technologies, socioeconomic practices and conditions, as well as the need to improve human capacity. During the last three decades, maize breeders at IITA in collaboration with national scientists of WCA have addressed ecologically specific adaptive traits, including the varietal development of resistance to MSV, *Helminthosporium* leaf blight (*H. maydis*), *Striga* spp., and stem borers, as well as tolerance to drought and low soil nitrogen (N). Also critical was the development of a vibrant seed sector. In spite of the substantial effort in breeding and the large number of new varieties released in WCA since the 1990s, impacts of maize research and development have not been as high as expected, partly due to the nonavailability of good-quality improved seeds for farmers. Public sector production and marketing of seeds have achieved mixed results but have often been limited by inadequate resources and poor management.

The early and extra-early maturing varieties are used for filling the hunger gap in the savannas of SSA, and this has allowed the early and extra-early varieties to spread into the shorter rainfall areas which for a long time had been precluded from maize production. Within the framework of the IITA Maize Improvement Program,

the ultimate goal of the early and extra-early maturing breeding unit has been to improve maize in the two maturity groups for biotic and abiotic stress tolerance. This program, undertaken in collaboration with NARS scientists of WCA, focused on developing breeding materials with resistance/tolerance to the major biotic and abiotic stress factors, including *Striga*, drought/heat stress, low soil N, MSV, rust, and leaf blight, as appropriate in all agroecologies. The program has since inception focused on four strategies for the two maize maturity groups: development of stress-tolerant (*Striga* resistant, drought and low-N tolerant) maize source populations for recurrent selection; improvement of source populations using recurrent selection with reliable artificial field infestation and screening methods to increase resistance to relevant stresses in the breeding materials; extraction of open-pollinated varieties (OPVs), inbred lines, and hybrids from source populations; and germplasm enhancement.

This book reviews the methodologies, strategies, and advances in maize improvement in SSA during the last three decades with special emphasis on the early and extra-early maize. Some aspects of research activities relevant to the intermediate- and late-maturing maize in which substantial progress has been made in improving resistance to downy mildew, stem borers, and aflatoxin-producing fungi by IITA maize breeders during the last three decades have also been reviewed in the book. Despite the tremendous progress made in developing and promoting maize varieties and hybrids, over one-third of the maize area in WCA is still planted with farmer-saved, low-yielding varieties (Arega et al. 2009). At the same time, many farmers continue to use seed saved from their farms because improved varieties are either not accessible to them or they regard improved seed as too costly. Since maize is an open-pollinated crop, farm-saved seed can quickly lose its genetic purity, implying that farmers who wish to grow improved varieties must replace their seed regularly, annually in the case of hybrid varieties and every 2–3 years in the case of OPVs. The development and dissemination of maize varieties and hybrids adapted to the increasingly drought-prone conditions and *Striga* endemic savannas require ongoing support to avert hunger and malnutrition in SSA.

Acknowledgments

We gratefully acknowledge the financial support of the DTMA/STMA Project since 2007 and USAID from 1987 to 2007 for the research reported in this book. The United Nations Development Programme (UNDP), the International Fund for Agricultural Development (IFAD), and the Nippon Foundation provided additional financial support for the research reported herein from 1998 to 2006 through the Africa Maize Stress (AMS) Project. We express our sincere thanks for the research facilities provided by INERA at the Kamboinse Research Station, Burkina Faso, from 1987 to 1993 and by the Centre National de Recherche Agronomique (CNRA) at Ferkessédougou, Côte d'Ivoire. The cooperation of the director general of INERA and CNRA, heads of stations, and Burkinabe and Ivorian scientists in the respective countries has contributed significantly to the successful execution of the research activities, and for this we are very grateful. We express our appreciation to the AU-SAFGRAD/STRC Coordination Office in Ouagadougou for the administrative support during the period 1987–1993. The Africa Rice Center, Bouake, Côte d'Ivoire, provided space and logistical support for the breeding program on the early and extra-early maize for about 9 years, and we express our appreciation. We acknowledge CIMMYT for providing some of the germplasm used in the early and extra-early maize activities, along with some of the information reported in this book as well as good collaboration. We would also like to thank Drs. Alpha Diallo and J.M. Fajemisin, the first two coordinators of WECAMAN for laying a strong foundation upon which the program was built. The late Dr. M. Quin, former IITA director of the Crop Improvement Program; Dr. J.P. Ekebil, former deputy director general for International Cooperation of IITA; Drs. J.M. Menyonga and T. Bezuneh, international coordinators of OAU/SAFGRAD; Dr. Mahama Ouedraogo of AU/SAFGRAD-STRC; and Mr. F. Deganus have made significant contributions to the success of the activities reviewed in this book, and we acknowledge this. The activities reported in this book were fully supported by the IITA management, particularly Dr. Robert Asiedu, director of the West Africa Hub of IITA, and Dr. Ylva Hillbur, former IITA deputy director general R4D, with their unflinching support over the years, which has contributed significantly to the success of the early and extra-early maize program at IITA. We would like to acknowledge the support of

fellow IITA, DTMA/STMA Project, and national maize scientists of West and Central Africa (WCA), particularly Drs. A. Menkir, T. Abate, S.O. Ajala, T. Abdoulaye, K. Obeng-Antwi, J. Onyibe, C. Yallou, A. Kamara, S.K. Kim, and N'Tji Coulibaly for their collaboration and immense contribution to the success of the research on early and extra-early maize. We are grateful to all the support staff of the IITA Maize Improvement Program (MIP), especially Messers A. Talabi, B. Annor, and M. Aderounmu, as well as the former support staff including Drs. M. Oyekunle and R. Akinwale and Mr. S. Makinde for their hardwork, amiable commitment, and unflinching support. Our Ph.D. students, S. Adewale, C. Nelimor, E. Obeng-Bio, T. Noudiloule, O. Ayanniyi, and O. Toyinbo, assisted with the editing and proofreading of some specific chapters for which we are very grateful. Finally, we would like to express our sincere thanks to Professor J.G. Kling of Oregon State University, USA; Professors A.O. Salami, O.K. Adekunle, and A.S. Bamire and Drs. B.O. Odu, Dr. A. Akinola, and O.J. Soyelu, all of Obafemi Awolowo University, Ile-Ife, Nigeria; and Dr. Togola and Alejandro Ortega-Beltran, both of IITA, as well as Dr. Francis Nweleni of Africa Rice, Ibadan, Nigeria, for the critical and constructive review of some chapters of the book.

Abbreviations and Acronyms

AMMI	Additive main effect and multiplicative interaction
ANOVA	Analysis of variance
ASI	Anthesis–silking interval
GGE	Genotype–genotype environment
CGIAR	Consultative Group on International Agricultural Research
CIMMYT	(Centro Internacional de Mejoramiento de Maíz y Trigo) International Maize and Wheat Improvement Center
CRI	Crops Research Institute
DA	Days to anthesis
DAS	Days after mid-silk
DAP	Days after planting
DC	Double cross
DH	Doubled haploids
DS	Days to silking
DTC	Double topcross
DT	Drought tolerant
DUS	Distinctness, uniformity, stability
DTMA	Drought-Tolerant Maize for Africa
E%	Emergence percentage
EASP	Ear aspect
EFPD	Effective filling period duration
EI	Emergence index
EPP	Number of ears per plant
ERI	Emergence rate index
ESA	East and Southern Africa
EV	Experimental variety
FAOSTAT	Food and Agriculture Organization Corporate Statistical Database
G%	Germination percentage
GCA	General combining ability
GEI	Genotype by environment interaction
GI	Germination index

GR	Growth rate
GS	Genomic selection
GWS	Genome-wide selection
HST	Hybrid seed technology
HSGCA	Heterotic groups' specific and general combining ability
ICIPE	International Center for Insect Physiology and Ecology
IITA	International Institute of Tropical Agriculture
IPTT	International Progeny Testing Trial
LSD	Least significant difference
KARI	Kenya Agricultural Research Institute
MAS	Mid-altitude savanna
MAS	Marker-assisted selection
MABC	Marker-assisted backcrossing
MARS	Marker-assisted recurrent selection
MB	Marker-assisted breeding
MCMC	Markov chain Monte Carlo algorithms
MH	Mid-parent heterosis
MI	Multiple stress tolerance base index
MLN	Maize lethal necrosis
MSC	Modified single cross
MSV	Maize streak virus
MTWC	Modified three-way cross
NARIs	National Agricultural Research Institutes
NARS	National Agricultural Research Systems
NARES	National research and extension system
NIP	Noninbred parent
NGS	Northern Guinea savanna
OPVs	Open-pollinated varieties
PASP	Plant aspect
PCR	Polymerase chain reaction
PHMD	Plant Health Management Division
PLHT	Plant height
PM	Physiological maturity
QEI	QTL by environment interaction
QPM	Quality protein maize
QTL	Quantitative trait locus
RAPD	Random amplified polymorphic DNA
RFLP	Restriction fragment length polymorphisms
RGR	Relative growth rate
RILs	Recombinant inbred lines
SCA	Specific combining ability
SAFGRAD	Semi-Arid Food Grain Research and Development
SNP	Single nucleotide polymorphism
SSLP	Simple sequence length polymorphism
SSA	Sub-Saharan Africa

SSR	Simple sequence repeat
STRs	Short tandem repeats
TC	Topcross
TWC	Three-way cross
USA	United States
VC	Varietal cross
WA	West Africa
WAP	Week after planting
WARDA	West Africa Rice Development Association
WCA	West and Central Africa
WECAMAN	West and Central Africa Collaborative Maize Research Network

List of Figures

Fig. 2.1	Agroclimatic zones of West Africa	12
Fig. 2.2	Mean monthly rainfall in the forest (<i>RF</i>) and northern Guinea savanna (<i>NGS</i>) agroecologies of West Africa	13
Fig. 2.3	Rainfall pattern for the different agroecologies of West Africa. The horizontal line at 100 mm marks the minimum moisture for maize growth	15
Fig. 2.4	Average daily sunshine hours received per month at Ibadan (lat 7° 23' N) and Kano (lat 11° 59' N).....	16
Fig. 2.5	Grain yield with standard errors (tha ⁻¹) of open-pollinated varieties (<i>upper graph</i> , 1967–1972) and the first set of IITA hybrids (<i>lower graph</i> , 1985–1988) evaluated in the different agroecological zones of Nigeria.....	19
Fig. 2.6	Mean annual maximum temperature at the Teaching and Research Farm of Obafemi Awolowo University, Ile-Ife, Nigeria, 1975–1992.....	22
Fig. 2.7	Total annual rainfall at the Teaching and Research Farm of Obafemi Awolowo University, Ile-Ife, Nigeria, 1975–2000	23
Fig. 2.8	Probability of drought and rain from the first week in March till the end of November at the Teaching and Research Farm of Obafemi Awolowo University, Ile-Ife, Nigeria, 1975–2000	24
Fig. 2.9	Parameters from the regression of grain yield on total moisture from planting to anthesis and silking and during the grain-filling stage of 25 early-maturing maize varieties, evaluated from 2012 to 2014 under managed moisture stress, naturally occurring drought, and optimal conditions	28
Fig. 2.10	Regression of grain yield on daily heat unit during the anthesis–silking interval of 25 early-maturing maize varieties, evaluated from 2012 to 2014 under managed drought stress, naturally occurring drought, and optimal conditions	29

Fig. 3.1	Idealized seed-filling stages in an early-maturing maize cultivar	37
Fig. 3.2	Water imbibition by the seeds of tropical maize varieties during a 72-h period. Each point on the graph is the mean of ten varieties and four replicates.....	42
Fig. 3.3	Number of days from planting to leaf formation stages in early-, intermediate-, and late-maturing maize cultivars evaluated at Ile-Ife.....	46
Fig. 3.4	Dry matter accumulation in the seeds of two maize hybrids evaluated in the rainforest agroecology of Nigeria	48
Fig. 3.5	Grain-filling rate during the linear phase in two maize hybrids evaluated in the rainforest agroecology of Nigeria	49
Fig. 5.1	Half-sib family (ear-to-row) selection.....	71
Fig. 5.2	Half-sib family selection using testers	72
Fig. 5.3	Full-sib family selection.....	74
Fig. 5.4	S ₁ family selection.....	75
Fig. 5.5	Half-sib reciprocal recurrent selection.....	76
Fig. 5.6	Full-sib reciprocal recurrent selection.....	77
Fig. 5.7	Graphical display of selection differential, <i>k</i> , versus selection intensity, %	80
Fig. 5.8	Flexible breeding scheme to develop open-pollinated maize varieties and hybrids from recurrent selection	82
Fig. 5.9	Grain yield of full-sib families extracted from three cycles of recurrent selection and evaluated under low N (20 kg ha ⁻¹) and high N (120 kg ha ⁻¹) in Samaru, Nigeria, in 1998. <i>Vertical lines on the bars</i> are standard errors (Adapted from Alabi et al. 2003).....	84
Fig. 5.10	Procedure for the development of <i>Striga</i> -resistant and drought-tolerant early-maturing yellow maize population and S ₁ progeny test.....	89
Fig. 5.11	Performance of the cycles of S ₁ selection in TZE-Y Pop DT STR (<i>above</i>) and TZE-W Pop DT STR (<i>below</i>) evaluated in <i>Striga</i> -infested and <i>Striga</i> -free environments	93
Fig. 5.12	Performance of the cycles of S ₁ selection in TZEE-Y Pop DT STR (<i>above</i>) and TZEE-W Pop DT STR (<i>below</i>) evaluated in <i>Striga</i> -infested and <i>Striga</i> -free environments	95
Fig. 5.13	Regression of (a) grain yield of low-N environments on grain yield of high-N environments and (b) grain yield of high-N environments on grain yield of low-N environments.....	98
Fig. 6.1	Response of grain yield of TZSR-W-1 maize population to 11 generations of inbreeding (Adapted from Fakorede et al. 1993).....	121
Fig. 6.2	Diagrammatic scheme of the pedigree breeding method for inbred line development.....	124

Fig. 7.1	Dendrogram of 17 early-maturing yellow maize inbred lines based on HSGCA values using Ward's minimum variance cluster analysis across drought, low N, and optimum conditions	146
Fig. 7.2	Consensus UPGMA dendrogram constructed using Ward's minimum variance cluster analysis of modified Roger's distance coefficients for 17 early-maturing yellow maize inbred lines.....	156
Fig. 7.3	Dendrogram of 17 early-maturing yellow maize inbred lines constructed from GCA effects of grain yield and other traits (HGCAMT) using Ward's minimum variance cluster analysis across drought, low N, and optimum conditions.....	156
Fig. 9.1	Scheme for converting a normal endosperm variety to QPM	220
Fig. 9.2	Backcross breeding procedure for converting normal endosperm maize to QPM.....	220
Fig. 11.1	Predicted grain yield under non-stressed environments as a function of performance of EASP, EPP, and PHT under stress environments for 50 early-maturing maize cultivars.....	290
Fig. 11.2	Regression of hybrid grain yield on mid-parent grain yield under managed drought stress environments	302
Fig. 11.3	Regression of hybrid grain yield under well-watered conditions on mid-parent values for days to silk (<i>top</i>) and anthesis–silking interval (<i>bottom</i>) under managed drought stress environments	303
Fig. 11.4	Regression of hybrid yield performance under optimal conditions on yield performance under drought stress	303
Fig. 12.1	GGE biplot of 25 early white maize hybrids evaluated under drought, combined heat and drought, and optimal conditions at 23 environments in Nigeria, 2012–2014	316
Fig. 12.2	GGE biplot of 26 early yellow maize hybrids evaluated under drought, combined heat and drought, and optimal conditions at 23 environments in Nigeria, 2012–2014	317
Fig. 12.3	GGE biplot of 19 extra-early white maize hybrids evaluated under drought, combined heat and drought, and optimal conditions at 23 environments in Nigeria, 2012–2014	318
Fig. 12.4	GGE biplot of 25 extra-early yellow maize hybrids evaluated under drought, combined heat and drought, and optimal conditions at 23 environments in Nigeria, 2012–2014	319
Fig. 12.5	Regression of the grain yield of extra-early white (EE-white) and yellow (EE-yellow) hybrids under heat + drought (H + D) stress and optimal (OPT) environmental conditions on the grain-yield performance of the hybrids evaluated under managed moisture stress conditions in Nigeria, 2012–2014	340

- Fig. 12.6 Path analysis model diagram showing causal relationships of measured traits of extra-early maturing white hybrids evaluated under managed drought stress at Ikenne, 2012–2014. **Bold** value is the residual effect; values in parenthesis are direct path coefficients, while other values are correlation coefficients. *RI* is residual effects, *ASI* anthesis–silking interval, *EASP* ear aspect, *EPP* ears per plant, *HC* husk cover, *PASP* plant aspect, *PHT* plant height, *STGR* stay-green characteristics, *RL* root lodging, *SL* stalk lodging, and *YD* grain yield 342
- Fig. 12.7 Path analysis model diagram showing causal relationships of measured traits of extra-early maturing white hybrids evaluated under combined heat and drought stress at Kadawa, 2012–2014. **Bold** value is the residual effect; values in parenthesis are direct path coefficients, while other values are correlation coefficients. *RI* is residual effects, *ASI* anthesis–silking interval, *DA* days to 50% anthesis, *DS* days to 50% silk, *EASP* ear aspect, *EHT* ear height, *EPP* ears per plant, *HC* husk cover, *LFR* leaf firing, *PASP* plant aspect, *PHT* plant height, *STGR* stay-green characteristics, *RL* root lodging, *SL* stalk lodging, and *YD* grain yield..... 342
- Fig. 13.1 Sequential path analysis showing relationship between grain yield and other agronomic traits of 56 maize cultivars evaluated under low-N conditions at four locations in Nigeria between 2013 and 2014 growing seasons. Values in parenthesis indicate direct effects, and those without parenthesis indicate correlation coefficients. “R” means residual effects. Lines with single-arrow head imply direct effects, and double-arrowed lines indicate indirect effect. *YD* grain yield, *PA* plant aspect, *SL* stalk lodging, *DS* days to silking, *EA* ear aspect, *PH* plant height, *STGR* stay-green characteristic, *EPP* ears per plant, *ER* ear rot, *HC* husk cover, *ASI* anthesis–silking interval, *DA* days to anthesis, and *EH* ear height..... 371
- Fig. 13.2 Sequential path analysis showing relationship between grain yield and other agronomic traits of 56 maize cultivars evaluated under high-N conditions at four locations in Nigeria between 2013 and 2014 growing seasons. Values in parenthesis indicate direct effects, and those without parenthesis indicate correlation coefficients. “R” means residual effects. Lines with a single arrow head imply direct effects, and double-arrowed lines indicate indirect effect. *YD* grain yield, *PA* plant aspect, *EA* ear aspect, *DA* days to anthesis, *HC* husk cover, *SL* stalk lodging, *PH* plant height, and *EH* ear height..... 372

- Fig. 15.1 Grain-yield response of TZBR Eldana-1 to seven cycles of recurrent selection for borer resistance evaluated at Ibadan, Nigeria, 1999 (Adapted from Table 1 of Ajala et al. 2001) 421
- Fig. 16.1 A vector view of genotype-by-trait biplot showing the ranking of the 90 extra-early inbreds on the basis of their mean performance across 6 selected drought tolerance traits. “T” (TZEEL) followed by a number represents inbred lines that were closest to the ideal genotype under drought stress, while* represents exact positions of other inbreds that were less responsive under drought stress 435
- Fig. 17.1 The “discriminating power and representativeness” view of GGE biplot based on genotype x environment yield data of 18 early-maturing maize cultivars evaluated in 15 locations across WA between 2006 and 2008. The data were not transformed (“Transform=0”), were not standardized (“Scaling=0”), and were environment-centered (“Centering=2”). The biplot was based on genotype-focused singular value partitioning (“SVP = 2”) and is therefore appropriate for visualizing the relationships among environments. Principal component (PC) 1 and PC 2 explained 51.1% of yield variation 462
- Fig. 17.2 The discriminating power and representativeness view of GGE biplot based on genotype x environment yield of 21 extra-early hybrids evaluated at three locations between 2010 and 2011 468
- Fig. 18.1 Response of cycles of full-sib recurrent selection in Pool 16 DT for drought tolerance when evaluated under water-deficit and well-watered environment and across environments (Badu-Apraku et al. 1997)..... 483
- Fig. 18.2 An entry/tester view of genotype x trait biplot of six selected traits of 20 early-maturing maize inbred lines evaluated under managed moisture stress at Ikenne, Nigeria, in 2007 and 2008. The data were not transformed (“Transform = 0”), were standardized (“Scaling = 1”), and trait-centered (“Centering = 2”). The biplot was based on trait-focused singular value partitioning (“SVP = 1”) and is therefore appropriate for visualizing the relationships among genotypes. The horizontal line passing through the biplot origin and the average tester, with an arrow pointing to the average tester, and its ordinate passing through the origin and perpendicular to the abscissa is called the average tester axis or ATC abscissa. Principal component (PC) 1 and PC 2 for model 2 explained 69.4% of the variation among traits. Abbreviations: *YIELD* grain yield, *EPP* ears per plant, *PASP* plant aspect, *EASP* ear aspect, *ASI* anthesis–silking interval, *LDTH* leaf death score..... 492

Fig. 18.3	An entry/tester view of genotype \times trait biplot of seven selected traits of 20 early maturing maize inbred lines evaluated under low-N conditions at Mokwa, Nigeria, in 2007 and 2008. The data were not transformed (“Transform = 0”), were standardized (“Scaling = 1”), and genotype-centered (“Centering = 2”). The biplot was based on genotype-focused singular value partitioning (“SVP = 1”) and is therefore appropriate for visualizing the relationships among genotypes. The horizontal line passing through the biplot origin and the average tester, with an arrow pointing to the average tester, and its ordinate passing through the origin and perpendicular to the abscissa is called the average tester axis or ATC abscissa. Principal component (PC) 1 and PC 2 for model 2 explained 73.8% of the variation among traits. Abbreviations: <i>YIELD</i> grain yield, <i>EPP</i> ears per plant, <i>PASP</i> plant aspect, <i>EASP</i> ear aspect, <i>ASI</i> anthesis–silking interval, <i>LDTH1</i> leaf death score at 56 days after planting, <i>LDTH2</i> leaf death score at 70 days after planting.....	493
Fig. 19.1	Variety release channel in Ghana	505
Fig. 19.2	Variety release channel in Mali	506
Fig. 19.3	Variety release channel in Nigeria.....	507
Fig. 19.4	Locations in the major agroecological zones in West Africa used for testing extra-early maize cultivars in the RUVT-extra-early from 2006 to 2009.....	511
Fig. 19.5	The “discriminating power and representativeness” view of GGE biplot based on a genotype \times environment yield data of 12 extra-early maturing maize cultivars evaluated in 17 locations across WA between 2006 and 2009. The data were not transformed (“Transform = 0”), not standardized (“Scaling = 0”), and were environment-centered (“Centering = 2”), and were environment-centered (“Centering = 2”). The biplot was based on genotype-focused singular value partitioning (“SVP = 2”) and is therefore appropriate for visualizing the relationships among environments. Principal component (PC) 1 and PC 2 explained 0.74 of yield variation (see Table 19.1 for the legend).....	512
Fig. 19.6	Quantity of seeds of drought-tolerant varieties and hybrids produced and disseminated to DTMA partners in West Africa, 2007–2014 (Source: DTMA Milestone Report for 2014).....	518

Table 5.3	CIMMYT International Progeny Testing Trial (IPTT) scheme	82
Table 5.4	Designation and description of maize streak virus-resistant populations under improvement by recurrent selection at IITA in the 1980s (from Efron et al. 1989).....	83
Table 5.5	Procedure adopted for the development of the <i>Striga</i> -resistant, drought-tolerant, early-maturing, yellow and white maize populations.....	86
Table 5.6	S_1 progenies derived from each of the populations evaluated in Nigeria under artificial infestation with <i>S. hermonthica</i> at Abuja and Mokwa in 2003.....	93
Table 5.7	Level of statistical significance of mean squares from the analysis of variance for agronomic traits associated with four cycles of S_1 recurrent selection in TZE-Y Pop DT STR and TZE-W Pop DT STR maize populations evaluated in <i>Striga</i> -infested and <i>Striga</i> -free environments in Nigeria in 2005 and 2006	96

Table 5.8	Changes in <i>Striga</i> resistance traits under <i>Striga</i> infestation, along with agronomic traits associated with four cycles of S ₁ recurrent selection in TZE-Y Pop DT STR and TZE-W Pop DT STR maize populations evaluated in <i>Striga</i> -infested and <i>Striga</i> -free environments in Nigeria, 2005–2007.....	97
Table 5.9	Level of statistical significance of mean squares from the analysis of variance for agronomic traits associated with four cycles of S ₁ recurrent selection in TZEE-Y Pop DT STR and TZEE-W Pop DT STR maize populations evaluated in <i>Striga</i> -infested and <i>Striga</i> -free environments in Nigeria in 2005 and 2006	99
Table 5.10	Changes in <i>Striga</i> resistance traits under <i>Striga</i> infestation, along with agronomic traits associated with four cycles of S ₁ recurrent selection in TZEE-Y Pop DT STR and TZEE-W Pop DT STR maize populations evaluated in <i>Striga</i> -infested and <i>Striga</i> -free environments in Nigeria, 2005–2007.....	101
Table 5.11	Grain yield and other agronomic characters of derived cultivars from S ₁ recurrent selection in TZE-Y Pop DT STR and TZE-W Pop DT STR maize populations evaluated under <i>Striga</i> -free (non-inf.) and <i>Striga</i> -infested (inf.) conditions averaged across six locations in West Africa in 2002.....	102
Table 5.12	Grain yield (kg ha ⁻¹) and other traits of derived cultivars from four cycles of S ₁ recurrent selection in TZEE-Y Pop DT STR and TZEE-W Pop DT STR maize populations evaluated in <i>Striga</i> -infested and <i>Striga</i> -free environments in Nigeria, 2005–2007	103
Table 5.13	Grain yield and other agronomic traits of maize cultivars of three breeding eras evaluated under managed drought stress at Ikenne and natural drought stress at Samaru between 2010 and 2012 and optimum conditions at 24 environments in Nigeria, Benin, and Ghana in 2010 and 2011.....	105
Table 5.14	Mean and standard error of grain yield and other agronomic traits of maize cultivars of three breeding eras evaluated under <i>Striga</i> -infested and <i>Striga</i> -free conditions in Nigeria and Benin between 2010 and 2011	106
Table 5.15	Minimum, maximum, and mean \pm se of grain yield of maize cultivars of three breeding eras evaluated under low- and high-N conditions at Mokwa and Ile-Ife in 2010 and 2011.....	106
Table 5.16	Mean grain yield (kg ha ⁻¹) \pm SE for three breeding eras, regression parameters, and percent genetic gain era ⁻¹ for early-maturing maize cultivars evaluated in two groups of environments in Benin, Ghana, and Nigeria, 2010 and 2011.....	108

Table 6.1	Levels of heterozygosity and homozygosity at different generations of inbreeding	120
Table 6.2	Parameters from the regression of mean values of grain yield and agronomic traits at different generations of inbreeding on the coefficient of inbreeding in the TZSR-W maize population (Fakorede et al. 1993)	121
Table 6.3	Parameters from the regression of mean values of grain yield at different generations of inbreeding on the coefficient of inbreeding for five lines derived from TZSR-W maize population (Fakorede et al. 1993)	122
Table 6.4	Inbreeding depression (%) at the S ₁ and S ₄ generations of lines derived from TZSR-W-1, TZPB (FARZ 27), and TZB (FARZ 34) maize populations.....	123
Table 6.5	Mean values of grain yield and agronomic traits of 25 early yellow inbred lines evaluated under multiple stresses (drought, low N, and <i>Striga</i> infestation) at 6 environments in Nigeria between 2012 and 2014	126
Table 6.6	Inbreeding depression (%) for agronomic traits and grain yield of TZSR-W maize population at two levels of inbreeding using single-seed descent and pedigree selection methods	129
Table 6.7	Number of hybrids obtainable when inbred lines are crossed in all possible combinations.....	130
Table 6.8	Mean characters of 17 extra-early inbred lines evaluated under <i>Striga</i> infestation and <i>Striga</i> -free conditions at Abuja and Mokwa, in 2004, and Ferkessédougou in 2001 and 2002	134
Table 7.1	Mean values (\pm s.e) for grain yield of hybrids within and between heterotic groups based on SCA, HSGCA, and SSR-based genetic distance methods under each and across <i>Striga</i> infestation and <i>Striga</i> -free conditions.....	151
Table 7.2	Sum of squares from the linear contrasts of heterotic groups based on HSGCA, HGCAMT, and SNP-based genetic distance of grain yield under drought, low N, and optimum and across research conditions	157
Table 7.3	Characteristics of extra-early maturing white inbred testers	161
Table 7.4	Characteristics of extra-early maturing yellow and provitamin A inbred testers.....	163
Table 7.5	Characteristics of early-maturing white inbred testers	166
Table 7.6	Characteristics of early yellow maturing and provitamin A inbred testers	167
Table 7.7	Characteristics of extra-early maturing and early-maturing QPM white inbred testers	171
Table 7.8	Characteristics of early-maturing white and yellow QPM inbred testers	173
Table 7.9	Characteristics of early and extra-early single-cross testers	174

Table 9.1	Grain yield, days to mid-silking, and plant height of late- and medium-maturing maize varieties evaluated at seven locations in Ghana during the major and minor seasons of 2004.....	224
Table 9.2	Characteristics of early- and extra-early maturing, normal endosperm and QPM varieties evaluated in <i>Striga</i> -infested and <i>Striga</i> -free environments in Nigeria, 2006–2008.....	227
Table 9.3	Grain yield (kg ha ⁻¹) and agronomic characters of extra-early QPM varieties evaluated at Mokwa, Zaria, and Ikenne, 2006–2007	235
Table 9.4	Grain yield and agronomic characters of intermediate/late-maturing QPM varieties evaluated at Ikenne, Mokwa, Zaria, and Saminaka in 2006	235
Table 9.5	Grain yield and agronomic characters of testcrosses of intermediate/late-maturing QPM lines evaluated at Ikenne, Saminaka, and Zaria in 2006	236
Table 9.6	The 24 provitamin A early QPM inbred lines selected for the NCD 2 crosses at Ibadan, Nigeria.....	239
Table 10.1	A scoring scale used at IITA for rating <i>Striga</i> host damage on maize.....	250
Table 10.2	Response of grain yield to four cycles of S ₁ recurrent selection in two early and two extra-early maize populations evaluated in <i>Striga</i> -infested and <i>Striga</i> -free environments in Nigeria, 2005 and 2006.....	258
Table 10.3	Response of <i>Striga</i> traits to four cycles of S ₁ recurrent selection in two early and two extra-early maize populations evaluated in <i>Striga</i> -infested environments in Nigeria, 2005 and 2006.....	259
Table 10.4	Response of some agronomic traits to four cycles of S ₁ recurrent selection in two early and two extra-early maize populations evaluated in <i>Striga</i> -infested and <i>Striga</i> -free environments in Nigeria, 2005 and 2006.....	260
Table 10.5	Grain yield and other agronomic characters of cultivars derived from S ₁ recurrent selection in TZE-Y Pop DT STR and TZE-W Pop DT STR maize populations evaluated under <i>Striga</i> -free (non-inf.) and <i>Striga</i> -infested (inf.) conditions averaged across six locations in West Africa in 2002.....	262
Table 10.6	Grain yield (kg ha ⁻¹) and other traits of maize cultivars derived from four cycles of S ₁ recurrent selection in TZEE-Y Pop DT STR and TZEE-W Pop DT STR maize populations under <i>Striga</i> -infested and <i>Striga</i> -free environments in Nigeria, 2005–2007	263

Table 10.7	Components of variance and heritability estimates of grain yield and agronomic traits of Design I progenies from TZE-W Pop DT STR C ₃ evaluated under artificial <i>Striga</i> infestation in Ferkè in 2002 and Mokwa in 2003	266
Table 10.8	Estimates of genetic variance (\pm standard error) and broad-sense heritability on an entry mean basis (\pm standard error) for grain yield and other traits of S ₁ families derived from the C ₀ and C ₄ of S ₁ recurrent selection in TZE-W Pop DT STR population evaluated under artificial <i>Striga hermonthica</i> infestation in Mokwa and Abuja and under <i>Striga</i> -free environments in Mokwa and Ikenne, Nigeria, 2006 and 2007	267
Table 10.9	Component of variance and heritability estimates of grain yield and agronomic traits of Design I progenies from TZE-Y Pop DT STR C ₃ evaluated under artificial <i>Striga</i> infestation in Abuja and Mokwa in 2003.....	269
Table 10.10	Estimates of genetic variance (\pm SE) and broad-sense heritability (\pm SE) for measured traits of 50 S ₁ lines derived from four cycles of selection in the TZE-Y Pop STR maize population evaluated under artificial <i>Striga</i> infestation at Mokwa and Abuja and <i>Striga</i> -free environments at Ikenne and Mokwa, Nigeria, in 2005 and 2007.....	270
Table 10.11	Genetic correlations between selected pairs of traits of S ₁ lines derived from four cycles of selection in TZE-Y Pop STR tested under <i>Striga</i> -free environments at Ikenne and Mokwa and <i>Striga</i> -infested environments at Mokwa and Abuja, Nigeria, in 2005 and 2007.....	273
Table 10.12	Genetic correlations between selected pairs of traits of S ₁ lines derived from four cycles of selection in TZEE-W Pop STR under <i>Striga</i> -free (Mokwa and Ikenne) and <i>Striga</i> -infested environments (Abuja and Mokwa) in 2006 and 2007.....	275
Table 11.1	Percentage reduction in maize grain yield as a result of drought (Banziger et al. 2000)	288
Table 11.2	Heritability for agronomic traits and correlation with yield under drought.....	292
Table 11.3	Correlation coefficients of grain yield with other agronomic traits of 50 maize cultivars from 3 breeding eras evaluated under drought stress and optimal growing conditions at 28 environments in Nigeria, Ghana, and Benin Republic between 2010 and 2012	299
Table 11.4	Correlation between inbred line per se performance and F ₁ hybrid yield under drought stress and optimal conditions.....	301

Table 11.5	Grain yield and other agronomic traits of early-maturing maize cultivars of three breeding eras evaluated under managed drought stress at Ikenne and natural drought stress at Samaru between 2010 and 2012 and optimum conditions at 24 environments in Nigeria, Benin, and Ghana in 2010 and 2011.....	305
Table 12.1	Evaluation of early white maize hybrids under drought (3 environments), combined heat and drought (3 environments), and optimal conditions (17 environments) in Nigeria, 2012–2014	321
Table 12.2	Evaluation of early yellow maize hybrids evaluated under drought (3 environments), combined heat and drought (3 environments), and optimal conditions (17 environments) in Nigeria, 2012–2014	325
Table 12.3	Evaluation of extra-early white maize hybrids evaluated under drought (3 environments), combined heat and drought (3 environments), and optimal conditions (17 environments) in Nigeria, 2012–2014	329
Table 12.4	Evaluation of extra-early yellow maize hybrids evaluated under drought (3 environments), combined heat and drought (3 environments), and optimal conditions (17 environments) in Nigeria, 2012–2014	332
Table 12.5	Genetic variances and heritability estimates of 25 early white hybrids evaluated under 3 drought, 3 heat and drought, and 17 optimal environments in Nigeria, 2012–2014	337
Table 12.6	Genetic variances and heritability estimates of 25 early yellow hybrids evaluated under 3 drought, 3 heat and drought, and 17 optimal environments in Nigeria, 2012–2014.....	338
Table 12.7	Genetic variances and heritability estimates of 19 extra-early white hybrids evaluated under 3 drought, 3 heat and drought, and 17 optimal environments in Nigeria, 2012–2014.....	338
Table 12.8	Genetic variances and heritability estimates of 25 extra-early yellow hybrids evaluated under 3 drought, 3 heat and drought, and 17 optimal environments in Nigeria, 2012–2014	339
Table 12.9	Correlation coefficients for grain yield of early and extra-early maize hybrids evaluated under drought stress, heat + drought stress, and optimum environments for 3 years.....	339
Table 12.10	Order of traits identified in the sequential stepwise regression of grain yield on agronomic traits of early white and yellow hybrids evaluated under managed moisture stress, combined heat + drought stress, and optimal environmental conditions in Nigeria, 2012–2014.....	343

Table 12.11	Order of traits identified in the sequential stepwise regression of grain yield on agronomic traits of extra-early white and yellow hybrids evaluated under managed moisture stress, combined heat + drought stress, and optimal environmental conditions in Nigeria, 2012–2014.....	344
Table 12.12	Grain yield and other agronomic characters of extra-early varieties in the 2013 RUVT—extra-early evaluated across six locations in West and Central Africa	345
Table 12.13	Grain yield and other agronomic traits of extra-early maize varieties in the 2014 RUVT—extra-early evaluated across eight locations in Nigeria.....	348
Table 12.14	Grain yield and other agronomic traits of S_1 families of TZEE-W POP DT C_2 STR C_5 evaluated under drought stress at Ikenne during 2015–2016 dry season and Kadawa in 2016 growing season	350
Table 12.15	Grain yield and other agronomic traits of S_1 families of TZEE-Y POP DT C_2 STR C_5 evaluated under drought stress at Ikenne during 2015/2016 dry season and Kadawa in 2016 growing season	352
Table 12.16	Extra-early maize inbreds selected for outstanding performance under combined heat and drought stress in 2013 and 2014.....	355
Table 12.17	Early maize inbreds selected for outstanding performance under combined heat and drought stress in 2013 and 2014.....	356

List of Plates

Plate 4.1	Shoot bagging	56
Plate 4.2	Tassel bagging	58
Plate 4.3	Controlled pollination.....	60
Plate 10.1	<i>Striga</i> -resistant and <i>Striga</i> -susceptible genotypes.....	247
Plate 10.2	Effect of <i>Striga hermonthica</i> parasitism on maize	247
Plate 11.1	Spotty seed set in maize as a result of drought.....	288
Plate 13.1	Effect of low soil nitrogen on grain yield	360
Plate 14.1	Typical symptoms of gray leaf spot (GLS)	381
Plate 14.2	Symptoms of the northern corn leaf blight incited by <i>Exserohilum turcicum</i>	382
Plate 14.3	Symptoms of the southern corn rust incited by <i>Puccinia polysora</i> . The rust spores are shown on the <i>right</i>	382
Plate 14.4	The vector of maize streak virus and the leaf hopper <i>Cicadulina mbila</i> (<i>left</i>) and the symptoms of the disease on a single maize leaf (<i>middle</i>) and foliage (<i>right</i>)	383
Plate 14.5	Symptoms of the maize strain of downy mildew incited by <i>Peronosclerospora sorghi</i> (Weston and Uppal; C.G. Shaw), with “crazy top” on the <i>right</i>	383
Plate 14.6	Maize ear rots incited by <i>A. flavus</i> Link:Fr. and <i>F. moniliforme</i> Sheldon.....	384
Plate 14.7	MSV-susceptible variety surrounded by resistant varieties under field conditions at the vegetative (<i>top</i>) and flowering (<i>bottom</i>) stages.....	391
Plate 14.8	MSV-susceptible variety planted into spreader rows 3 weeks before planting the genotypes to be screened for resistance under field conditions	392
Plate 14.9	Maize kernels infected with aflatoxin (<i>left</i>) and inoculation of an ear of maize with conidial suspension of the fungus using a syringe (<i>right</i>)	401

Plate 14.10	The fungus <i>Aspergillus flavus</i> sporulating on corn (By courtesy of Bandyopadhyay 2010).....	402
Plate 14.11	Corn kernels infected with <i>Fusarium moniliforme</i> (upper row) showing “starburst” symptom (By courtesy of Bandyopadhyay 2010).....	402
Plate 15.1	A maize field infested by the fall armyworm and a close up on a severely affected stand showing the ragged appearance (top). The larvae also infest tassels during the reproductive growth phase (bottom).....	424
Plate 20.1	Extra-early maize seedling emergence under 20, 25, and 30 °C in a climate growth chamber at the OAU Seed Laboratory, 2013.....	535
