Preface

Environmental Chemistry is a relatively young science. Interest in this subject, however, is growing very rapidly and, although no agreement has been reached as yet about the exact content and limits of this interdisciplinary discipline, there appears to be increasing interest in seeing environmental topics which are based on chemistry embodied in this subject. One of the first objectives of Environmental Chemistry must be the study of the environment and of natural chemical processes which occur in the environment. A major purpose of this series on Environmental Chemistry, therefore, is to present a reasonably uniform view of various aspects of the chemistry of the environment and chemical reactions occurring in the environment.

The industrial activities of man have given a new dimension to Environmental Chemistry. We have now synthesized and described over five million chemical compounds and chemical industry produces about hundred and fifty million tons of synthetic chemicals annually. We ship billions of tons of oil per year and through mining operations and other geophysical modifications, large quantities of inorganic and organic materials are released from their natural deposits. Cities and metropolitan areas of up to 15 million inhabitants produce large quantities of waste in relatively small and confined areas. Much of the chemical products and waste products of modern society are released into the environment either during production, storage, transport, use or ultimate disposal. These released materials participate in natural cycles and reactions and frequently lead to interference and disturbance of natural systems.

Environmental Chemistry is concerned with reactions in the environment. It is about distribution and equilibria between environmental compartments. It is about reactions, pathways, thermodynamics and kinetics. An important purpose of this Handbook is to aid understanding of the basic distribution and chemical reaction processes which occur in the environment.

Laws regulating toxic substances in various countries are designed to assess and control risk of chemicals to man and his environment. Science can contribute in two areas to this assessment; firstly in the area of toxicology and secondly in the area of chemical exposure. The available concentration ("environmental exposure concentration") depends on the fate of chemical compounds in the environment and thus their distribution and reaction behaviour in the environment. One very important contribution of Environmental

Chemistry to the above mentioned toxic substances laws is to develop laboratory test methods, or mathematical correlations and models, that predict the environmental fate of new chemical compounds. The third purpose of this Handbook is to help in the basic understanding and development of such test methods and models.

The last explicit purpose of the Handbook is to present, in concise form, the most important properties relating to environmental chemistry and hazard assessment for the most important series of chemical compounds.

At the moment three volumes of the Handbook are planned. Volume 1 deals with the natural environment and the biogeochemical cycles therein, including some background information such as energetics and ecology. Volume 2 is concerned with reactions and processes in the environment and deals with physical factors such as transport and adsorption, and chemical, photochemical and biochemical reactions in the environment, as well as some aspects of pharmacokinetics and metabolism within organisms. Volume 3 deals with anthropogenic compounds, their chemical backgrounds, production methods and information about their use, their environmental behaviour, analytical methodology and some important aspects of their toxic effects. The material for volume 1, 2 and 3 was each more than could easily be fitted into a single volume, and for this reason, as well as for the purpose of rapid publication of available manuscripts, all three volumes were divided in the parts A and B. Part A of all three volumes is now being published and the second part of each of these volumes should appear about six months thereafter. Publisher and editor hope to keep materials of the volumes one to three up to date and to extend coverage in the subject areas by publishing further parts in the future. Plans also exist for volumes dealing with different subject matter such as analysis, chemical technology and toxicology, and readers are encouraged to offer suggestions and advice as to future editions of "The Handbook of Environmental Chemistry".

Most chapters in the Handbook are written to a fairly advanced level and should be of interest to the graduate student and practising scientist. I also hope that the subject matter treated will be of interest to people outside chemistry and to scientists in industry as well as government and regulatory bodies. It would be very satisfying for me to see the books used as a basis for developing graduate courses in Environmental Chemistry.

Due to the breadth of the subject matter, it was not easy to edit this Handbook. Specialists had to be found in quite different areas of science who were willing to contribute a chapter within the prescribed schedule. It is with great satisfaction that I thank all 52 authors from 8 countries for their understanding and for devoting their time to this effort. Special thanks are due to Dr. F. Boschke of Springer for his advice and discussions throughout all stages of preparation of the Handbook. Mrs. A. Heinrich of Springer has significantly contributed to the technical development of the book through her conscientious and efficient work. Finally I like to thank my family, students and colleagues for being so patient with me during several critical phases of preparation for the Handbook, and to some colleagues and the secretaries for technical help.

I consider it a privilege to see my chosen subject grow. My interest in Environmental Chemistry dates back to my early college days in Vienna. I received significant impulses during my postdoctoral period at the University of California and my interest slowly developed during my time with the National Research Council of Canada, before I could devote my full time to Environmental Chemistry, here in Amsterdam. I hope this Handbook may help deepen the interest of other scientists in this subject.

Amsterdam, May 1980

Contents

The Atmosphere

M. Schidlowski

Chemical Composition	1
Origin of the Atmosphere	4
The Primitive Atmosphere	5
Water Vapor and Runaway Greenhouse Effect	6
Origin of Atmospheric Oxygen	8
Evolution of the Photosynthetic Oxygen Budget	9
Implications of the Oxygen Model	11
The Rise of Atmospheric Oxygen	13
References	15

The Hydrosphere

J. Westall and W. Stumm

Structure and Properties of Water	17
The Water Molecule	17
Hydrogen Bonding	19
Structure of Ice	19
Structure of Liquid Water	20
Thermodynamics and Physical Properties	21
Models of Liquid Water	24
Chemistry of Natural Waters	26
Kinetics and Chemical Equilibrium	26
Carbonate Equilibria	26
Complexation Chemistry	33
Solubility Equilibria	36
Surface Equilibria	36
Photosynthesis and Respiration	36
Redox Chemistry	38
Transformation of Organic Carbon	40

The Composition of Fresh Waters and the Hydrologic Cycle	41
Rainwater	41
Weathering Process	43
Minor Elements	45
The Hydrologic Cycle	47
References	48

Chemical Oceanography

P. J. Wangersky

Properties of Sea Water	51
Conservative and Non-Conservative Properties	53
Regions of the Oceans	56
Horizontal Divisions	56
Vertical Divisions	58
Controls on Composition and Reactions	62
Anthropogenic Materials	65
References	67

Chemical Aspects of Soil

E. A. Paul and P. M. Huang

Introduction	69
Composition of the Earth's Crust	70
Geochemical Classification and Distribution of the Elements	70
Igneous, Metamorphic and Sedimentary Rocks	71
Geological Classification of Parent Materials	72
Major Components of Soils	73
Mineral Components	73
Organic Components	76
Water, Air and Structure	81
Weathering Reactions and Soil Formation and Distribution	82
References	85

The Oxygen Cycle

J. C. G. Walker

Introduction	87
Gains and Losses of Atmospheric Oxygen	89
Oxidation of Reduced Organic Carbon	95
Controls on Atmospheric Oxygen	101
References	102

The Sulfur Cycle*A. J. B. Zehnder and S. H. Zinder*

Introduction	105
Global Sulfur Cycle	106
Contents of the Reservoirs	107
Transfer Mechanisms, Fluxes and Rates	115
Equilibrium Chemistry of Sulfur	123
Physical and Chemical Conversion of Sulfur Compounds	
in the Environment	125
Atmospheric Reactions	125
Aqueous Reactions	126
Sulfur Oxidation in the Lithosphere	126
Biological Transformations of Sulfur in the Environment	128
Sulfur Compounds in Biological Systems	128
Biological Reduction of Sulfur Compounds	132
Biological Oxidation of Sulfur Compounds	136
Microbial Production of Volatile Sulfur Compounds	138
Sulfur Isotope Fractionation by Biological Processes	138
References	141

The Phosphorus Cycle*J. Emsley*

Introduction	147
The Primary Inorganic Cycle	149
Phosphate Minerals	151
The Land-based Phosphate Biocycle	153
Soil Phosphate	153
The Land-based Biocycle	157
The Water-based Phosphate Biocycle	160
The Algae	161
Sediment	163
The Sea	164
References	166

Metal Cycles and Biological Methylation*P. J. Craig*

Biogeochemical Cycles and Methylation	169
Introduction	169
Biogeochemical Cycles	170
Methylcobalamin and Biomethylation Mechanism	172
Non-Cobalamin Dependent Methylation Routes	175
Demethylation Processes	177

Biogeochemical Cycles for Mercury	177
Introduction	177
The Natural Cycle	177
The Influence of Man	182
Biomethylation of Mercury	183
Biogeochemical Cycles for Lead	185
Introduction	185
The Natural Cycle	186
The Influence of Man	189
Biomethylation of Lead	195
Biogeochemical Cycles for Tin	197
Natural Cycles and the Influence of Man	197
Biomethylation of Tin	201
Other Metals – Natural Cycles and the Influence of Man	202
Introduction	202
Discussion	204
Theoretical Treatments of Cycling Processes	214
Biomethylation of Other Elements	214
Heavy Metals	214
Metalloids	217
References	221

Natural Organohalogen Compounds

D. J. Faulkner

Introduction	229
Marine Bacteria	229
Marine Algae	230
Sponges	240
Other Marine Invertebrates	245
Some Unusual Metabolites from Terrestrial Organisms	248
Biosynthesis of Halogenated Natural Products	248
Halogenated Natural Products in Seawater	250
References	251
