the light-saturation curves of the two photosystems remained approximately unchanged during senescence. These authors, however, described the senescence of attached leaves in the light; the results presented here were obtained from detached leaves senescing in the dark, a system which accelerates and accentuates the processes occurring during senescence.

We are grateful to Professor J. Barber, of the Agricultural and Food Research Council (AFRC) Photosynthesis Group at Imperial College, London, for his hospitality in providing facilities for some of the measurements of DCPIP photoreduction, and to Dr. Alison Telfer at that laboratory for assistance and helpful discussions. We also thank Fred Potter at WPBS for his patient assistance with the statistical and computing work. Paul Hilditch is an AFRC Research Assistant.
