Create Once, Use Many Times: The Clever Use of Recordkeeping Metadata for Multiple Archival Purposes

Joanne Evans, Sue McKemmish and Karuna Bhoday

Metadata for Records Standard (Smart Metadata Research and International Standards) and standards initiatives. Other papers in the session report on the related work of the InterPARES aims to communicate the progress and findings of several inter-related collaborative research projects purposes. It is presented as part of the Smart Metadata and the Archives of the Future session that systems, current recordkeeping systems and archival systems. This paper explores the relevance of the addresses the challenge of automating metadata creation and sharing metadata between business between schemas in these environments. The Monash Clever Recordkeeping Metadata (CRKM) project in relation to developing strategies and meta-tools for the translation of metadata attributes and values processes, electronic recordkeeping and archival description. Moreover there has been little progress functionality has not as yet been utilized in the systems that support eGovernment and eBusiness addressing the data representation requirements for metadata translation and exchange, this shared between applications. Although data modeling, mark up language and syntax initiatives are fully automated. Metadata created in one application of potential relevance to other applications is not deployment are currently resource intensive and application specific. Metadata creation is not usually well as their innovative use as archives, memory and knowledge. However metadata generation and Persistent Archives Technology (Metadata Tools and Sustainable Archives Technologies), and the ISO Extension of Pre-Existing Metadata), the San Diego Supercomputing Center's development of Description Research Team (Designing a Meta-Registry for the Registration, Analysis and Archival CRKM project to future archival systems and the deployment of metadata for multiple archival Metadata is a key component in the creation, management and preservation of electronic records, as

The Archives of the Future

It is possible to re-imagine archival systems of the future that:

- personal or corporate archive Manage the records of multiple groups and individuals beyond the boundaries of the
- juridical, organisational, functional, procedural, technological and recordkeeping Represent multidimensional contexts of creation, capture, organisation and pluralisation -
- Provide multiple views of parallel recordkeeping universes
- organisational structures, functions and activities to assist in preserving their evidential Continuously and cumulatively weave relationships between records and related people, value and enable multiple access paths to records and their meanings
- the records they form and transform. Keep records relating to all recordkeeping and archiving processes persistently linked to

agencies. In this sense, the collective archives could be preserved and made accessible in virtual value or not (of continuing value), still maintained in the recordkeeping systems of individual archival institution, but it might also link to all records, publicly available or not, of continuing records. The locus of the archives system might exist as an interface to archival records held by an Such archival systems would have great potential utility in relation to the preservation and accessibility of electronic records of continuing value, as well as to the management of current be of prime importance. (McKemmish et. al. 2005, Ch. 7). space. Custodial arrangements and issues of where the record is physically located would cease to

provenance" to refer to archival descriptive systems that could describe parallel recordkeeping provide meaningful access paths to all stakeholders. Chris Hurley has recently coined the term "parallel realities, encompass the world views of all the parties to the transactions the records document, and corporate archive, and of collective archives as we now know them, to describe multiple recordkeeping globalised societies of the 21st century, systems that can operate beyond the level of the individual or Archivists at the beginning of the new millennium are challenged to develop archival systems for the

be accommodated in systems defined by Pakeha standards, and to seek a set of alternative, equally valid ways of viewing and documenting the records. He is currently exploring how the Australian culturalism is more than mere rhetoric, Hurley began to question how the views of the Maori could largely reflects the cultural views of the Pakeha majority, but living in a society in which bi-Recognising that the documentation created within the New Zealand national archives system

other parties to the transaction, and other stakeholders, in and through time, from individual, and their contexts to be added by different communities of stakeholders. It is possible within these series system, and related metadata schema developments, with their powerful relational characteristics might accommodate such differences, enabling alternative readings of the records community, corporate and societal perspectives. (McKemmish et. al. 2005, Ch. 7) frameworks to represent records from different perspectives, from the point of view of the creator,

shared ownership and joint heritage (Ketelaar 2004; Bastian 2003). Bastian defines a community of concept of communities of records as developed by Jeannette Bastian, and associated ideas about Eric Ketelaar has explored the implications of this approach to archival practice with reference to the

the aggregate of records in all forms generated by multiple layers of actions and interactions between and among the people and institutions within a community (Bastian, 2003, p. 5).

entire community of records" (p. 3). Thus: creation that begins with the individual creator but can be fully realized only within the expanse of an According to this view, "the records of a community become the products of a multi-tiered process of

all layers of society are participants in the making of records, and the entire community becomes the larger provenance of the records (p. 83).

recordkeeping and archiving – ownership, custodianship, appraisal, description, access and so on mutual rights and obligations of all the parties involved and how they would extend to all aspects of Drawing out the implications of these conceptual approaches, Eric Ketelaar points to the matrix of

recordkeeping metadata is defined as: would need to capture in order to fulfil these multiple purposes. Within these frameworks, that integrated archiving and recordkeeping processes operating within broad archival frameworks management frameworks and schemas that specify the types of standardised information or metadata also negotiate and manage such matrices of mutual rights and obligations, are emerging metadata Essential to the development of archival systems of the future of the kind envisaged, systems that could

people, processes and systems involved in their creation, management and use (Wallace 2001, p. 255). Recordkeeping metadata is used to identify, authenticate, and contextualise records, as well as the in and through time, and within and across the domains in which they are created and used structured or semi-structured information that enables the creation, management and use of records

control system specifications can be envisaged as traditional forms of recordkeeping metadata schema. metadata elements, how they are structured, and their meanings. Archival descriptive standards and Metadata schemas provide semantic and structural definitions of metadata, including the names of

continuum community of practice. domains, is an emerging and distinguishing feature of the approach of the Australian records business applications and environments for further utilisation in broader cultural and accountability emphasis on the clever use of metadata, including the re-use and inheritance of metadata from different systems for the long-term preservation of records of historical and cultural value (archives). Thus an occurs across all recordkeeping environments, including business systems, recordkeeping systems, and Within a records continuum frame of reference, standardisation of metadata and descriptive practices

The Challenge

resource discovery metadata, as specified in the national standard (National Archives of Australia systems as sources of metadata; rather they re-create it - often in manual and resource intensive ways systems. But records management systems as currently implemented do not draw on these other desktop document authoring, web content management, human resource management, and work flow management systems are also created and used in a variety of other business applications, such as In current recordkeeping practice, many of the types of metadata created and used by records A parallel situation exists in relation to resource discovery metadata. For example, in Australia AGLS

ω

metadata or archival descriptive standards designed to support such access rely on similarly resource-intensive methods of retrospectively describing the records with reference to through gateways that operate above the level of individual archival institutions and collections also intensive as it seeks to retrospectively describe records. Efforts to provide access to archival records description, which assures the integrity and usability of records through time, is thus hugely resource metadata from current recordkeeping systems over fifteen years ago (Bearman 1989). Archival futility of such an approach and the need to develop strategies to enable descriptive systems to inherit retrieve the document. Archival organizations and programs also describe records of long-term value although this application would have also created almost identical metadata in order to manage and rather than being automatically supplied by the software in which the document was originally created, from scratch when they are transferred to their control, although David Bearman alerted us to the 2004) is most often created retrospectively at the time a document is made available on a web site.

purposes in different contexts in and through time tools that will enable metadata to be created once, then used and re-used many times for multiple and use in and through time will be essential. A key challenge is to develop systems, processes and capture and implementation of metadata which can describe multiple contexts of creation, management communities of records, and manage shared ownership, joint heritage and multiple access paths, the If archival systems of the future are to provide for emerging concepts of parallel provenance and

Interoperability

recordkeeping metadata standards to date. integrated system environments and clever metadata which underpins much of the development in towards an integrated suite of business systems and processes supporting recordkeeping and archiving associated with metadata interoperability. The aim is to demonstrate how we can begin to move away NSW, and the Australian Society of Archivists' Descriptive Standards Committee to explore issues The Clever Recordkeeping Metadata Project (CRKM) brings together researchers and practitioners from Monash University and UCLA, the National Archives of Australia, the State Records Office of functions, environments in which metadata can be created once and used many times. It is this vision of from the current, resource intensive processes of manual metadata attribution and stand-alone systems,

re-purposing the rich mines of metadata in our environments archiving processes, and reinventing archival description as a process of managing, augmenting, and the "business" case for automating the capture and re-use of metadata required for recordkeeping and (Reed 2003, p. 19) – but we need to take the lead in articulating our requirements and demonstrating Digital environments offer us the opportunity to move away from our "minimal descriptive systems"

intellectual property rights management: discussion of the <indecs> metadata framework which provides a reference model relating to There are many definitions of interoperability, but one of particular usefulness to us is that presented in

ways that are as highly automated as possible (Rust et. al. 2000, p. 6). Interoperability means enabling information that originates in one context to be used in another in

automated ways control systems can be re-located into parallel recordkeeping universes or other information spaces available to recordkeeping and other business systems. We want to explore how metadata in archival archival control systems and metadata which originates in archival control systems being made business systems. We want to see metadata in organisational recordkeeping systems being inherited by relevance to business processes which is created in records management applications being re-used in to recordkeeping being made available to records management applications, as well as metadata of This involves exploring how metadata can cross technical, spatial and temporal boundaries in With reference to this definition, we want to see metadata created in business systems which is relevant

Towards Integrated Systems

environments do not as yet support the integrated processes for sharing metadata and re-using it for metadata. In practice there have been significant implementation problems, as current systems implemented in integrated systems environments that enable the clever use and re-purposing of Recordkeeping metadata standards developers look to a future in which their standards will be

and standards. example, have so far had limited functionality focusing on identifying and describing metadata schema advances and standards initiatives. The metadata registries in the resource discovery sector, for metadata and the translation of metadata attributes and values has not kept pace with the theoretical such as metadata schema registries and mapping tools, which support the automatic creation of multiple purposes anticipated by the standards developers. Moreover the development of meta-tools,

supporting web services², as well as a proliferation of metadata standards initiatives supporting data structured data, lightweight communication protocols like SOAP, and other technical standards technologies to facilitate this integration, e.g. encoding languages like XML for the representation of across these components are also essential. This has led to the development of a number of accessed, invoked and manipulated by other system components. Standardized data representations applications to be viable in such environments, their data and services must be capable of being barrier is being brought down by the trend to open systems and component based architectures'. For metadata or data exchanged with other applications would be hard-coded into the application. This current systems for metadata sharing and re-use is a legacy of closed, proprietary systems where any current practical limitations are being overcome by technological developments. The lack of support in However, archivists are not alone in envisaging integrated system environments and some of the

applications. between metadata element sets and thus providing services to support metadata translation between how to use the element set for its purposes. There is also interest in these registries managing mappings software and/or human agents. With such metadata the agent can then determine the suitability and/or number of research and development projects have been undertaken or are underway to explore the architecture and functionality of schema registries to support metadata interoperability (OLIN; DCMI) The common vision is that such registries provide metadata about existing metadata element sets to There is also growing interest in metadata schema registries as tools to support metadata re-use.

aggregation, translations through time, and translations across contextual boundaries business systems, recordkeeping systems and archival systems, translations across levels of interchange. This relates to our need to examine how to make possible translations to and from processes is emerging compared with that taken by other communities interested in metadata and complex view of the translation requirements associated with recordkeeping and archiving Although these developments are of relevance to recordkeeping and archiving, a more comprehensive

Layers of Interoperability Model

"articulate a shared set of principles underlying the construction of metadata registries" (Baker et. al. In 2001-2002 researchers involved in pioneering metadata registry activities in the information management area came together as a Working Group on Metadata Registries, sponsored by the DELOS which issues associated with metadata re-use and re-purposing may be explored – see Figure 2002). In the resultant white paper they present a simple model of the layers of interoperability in Network of Excellence on Digital Libraries. Their aim was to consolidate their experiences and

Recordkeeping Metadata Initiatives

of standards, best practice models and guidelines developed to address the challenge of managing requirements for records management systems. In Australia, these initiatives have been part of a suite of a number of recordkeeping metadata standards and the specification of metadata needs in functional to this model. We can see that there has been much activity in the abstract layer with the development The current status of metadata initiatives in the recordkeeping domain can be described with reference

Management Consultants 2001; Public Record Office UK 2002). recordkeeping metadata standards developed by two of the industry partners in the CRKM Project, the a number of national and state government jurisdictions, including resource discovery and and 2002; International Standards Organisation 2001 and 2004), and standards and guidelines issued in term preservation and accessibility of the archival heritage (McKemmish 2000, Cunningham 2001) online, particularly in the areas of eGovernment and eBusiness, and to support the quality, and long trustworthy and accountable business processes, to provide better access to information resources State Records Authority NSW 2000; State Records of South Australia 2003; MoReq - Cornwell National Archives of Australia and the State Records Authority of NSW (NAA 1999.1 and 1999.2; The suite includes international and national records management standards (Standards Australia 1996 electronic records and other information objects. The main objectives have been to support reliable,

national and international level, particularly through the development and promotion of standards of the International Council on Archives Descriptive Standards Committee develop archival descriptive standards and models for descriptive practice. Examples include the work Standards, has been a contributor to the development of standardised descriptive practices at both interoperability layer. The project's third industry partner, the ASA Committee on Descriptive (<u>http://www.library.yale.edu/eac</u>). These initiatives have also mainly addressed the abstract EAD, Encoded Archival Description (http://www.loc.gov/ead) and EAC, Encoded Archival Context (http://www.ica.org/eng/mb.com/cds/descriptivestandards.html), and independent initiatives such as Over a longer period of time, there have been a number of initiatives nationally and internationally to

development of sector specific recordkeeping metadata schemas and archival description standards In Australia, the continuing evolution of the series system and the development of the Australian "reach towards ways of representing records and their contexts as richly and extensively as possible": Recordkeeping Metadata Schema (McKemmish et.al. 1999 and 2000) as a framework standard for the

through time (McKemmish et. al. 2005, Ch. 7). records to ever broadening layers of contextual knowledge in order to carry their meanings Hurley and Terry Cook. The contextualisation provided in the Schema enables the linking of creation, management, and use through spacetime, and informed by the insights of Chris and dynamic social, functional, organisational, procedural, and documentary contexts of concepts of context, drawing on records continuum thinking relating to a record's complex The Australian Recordkeeping Metadata Schema extends the Australian series system

implementation of such standards. environments and its re-use for archival and cultural heritage purposes, as essential to the successful metadata in archival description, in particular its inheritance from business applications and Standards Committee sees the development of processes and tools that support the clever use of confirm that in practice there are major problems with implementation of the standards (Australian provide better access to government information online and facilitate eGovernment, audit findings National Audit Office 2002 and 2003). In relation to archival descriptive practice, the ASA Descriptive Commonwealth government agencies are required to comply with recordkeeping metadata standards. interoperability identified in the model have not been addressed. For example, although recordkeeping and the lack of compliance with standards point to the fact that so far the lower layers of In both the Commonwealth and NSW public sectors, concerns about the quality of current As indicated above, such initiatives relate to the abstract attributes and values layer of interoperability government web sites must use Australian Government Locator Service (AGLS) metadata to

Recordkeeping Metadata Representations

issues in the translation between the abstract and representation layers may also need investigation. The transcend particular implementations and foster the required interoperability. As part of this work, developers want automated metadata capture and re-use then they need to explore encodings that attribute and value space in a machine processable form. So if recordkeeping metadata standard requirement for automated re-use and re-purposing of metadata is the expression of the concepts in the we can see from the interoperability model, and its definition of metadata registries, that an essential for records management systems have tended to see representation issues as implementation issues. But the representation layer. Developers of recordkeeping metadata standards or functional specifications So while there has been much activity in the abstract attributes and values layer, there has been less in white paper of the Working Group on Metadata Registries notes that the constraints of an encoding

00

language may mean adaptation or even distortion of the underpinning conceptual models (Baker et. al. 2002, p. 7). Thus any such impacts will need to be assessed and addressed

metadata to exchange' means that they can now turn their attention from questions of "how to exchange metadata" to "what For implementers and vendors, the progress made on the protocols for metadata transport and exchange used by all parties to gain shared understandings and insight into the issues that arise at this interface. an integrated system environment with tools to support metadata interchange. This environment can be to foster dialogue between standards developers, implementers and vendors through the prototyping of These representation issues are not for standard developers alone. It is the intent of the CRKM Project

Re-use and Re-purposing

capture and re-use that the CRKM Project is seeking to investigate. The layers of interoperability model can also be utilised to locate issues associated with metadata

temporal translations of attribute spaces required to support recordkeeping. will therefore need to look at whether these initiatives can be extended to allow for the spatial and cultural dimensions and unable to deal with changing meanings in time and place (Veltman 2004) We across boundaries, but their vision, at this stage, has been criticized as lacking understandings of Semantic Web community is developing technologies to facilitate automated data sharing and re-use interchange in business systems relate to "in time" rather than 'through time' on transforming metadata across similar resource description systems, while discussions of metadata interested in metadata interchange at this stage. In the information management area the focus has been comprehensive and complex view of translation requirements than that taken by other communities aggregation, translations through time, and translations across contextual boundaries possible translations between business systems and recordkeeping systems, translations across levels of registry. As our focus is on metadata related to recordkeeping, we need to examine how to make related project, InterPARES 2, outlined below, which is investigating the functionality of such a order to allow for automated translations between metadata sets. For this we can draw on the work of a In the attribute space, we need to explore how to describe and manage data about metadata schemas in translations. The a more

mappings between value spaces are made and defined them visible and explicit in order to preserve meanings. We may also need to investigate how how to make the underpinnings and contexts of "knowledge organisation systems" 3 used to construct transformations. To move metadata values through time and space we need to investigate when and Similarly we will need to examine how the value space can undergo multi-dimensional

going management. digital archiving and long term preservation, including metadata representation, translation and on-Supercomputer Center. These initiatives, as discussed below, have looked at tools and technologies for methods and tools to support automated translation in the representation layer. Of particular relevance to this aspect of the CRKM Project are research initiatives being undertaken at the San Diego As well as these issues in the abstract layer, we need to investigate and specify our requirements for

The CRKM: Conceptual Framework, Design and Methods

Conceptual Framework

sector specific recordkeeping metadata and archival descriptive standards, and is currently being Metadata Schema (McKemmish et al, 1999 and 2000), which provides a model for the development of management and recordkeeping metadata standards, including the Australian RKMS, Recordkeeping across space. It has also provided the conceptual framework for the development of Australian records complex, integrated systems and processes to manage records and archives in and through time, and continuum model (Upward 1996 and 1997, McKemmish 2002), which support the development of redeveloped as an Australian national standard. The recently published ISO technical specification The conceptual framework for the project is provided by records continuum theory and the records

³ The term *knowledge organization systems* encompasses the many tools used to classify, control and organize information, including authority lists, classification schemes, thesauri and ontologies. It was coined by the Networked Knowledge Organization Systems Working Group at its initial meeting in 1998.

specific schemas and their conceptual models are key components in the metadata management (ISO 2001 and 2004). The ISO recordkeeping metadata standard, Australian RKMS and related sector for records -- Part 1: Principles, also drew on this Schema, adopting its conceptual models to identify the types of metadata required to support the international records management standard, ISO 15489-1 ISO/TS 23081 -1:2004 Information and documentation - Records management processes - Metadata framework referenced by the CRKM Project.

Development of Proof of Concept Demonstrator

use scenarios as the basis for building the prototype. stage will include the development and documentation of metadata creation, management, and multiple required meta-tools to facilitate metadata translations can be iteratively developed and evaluated. This fictitious, though realistic, organisational setting. Within this environment, working models of the demonstrate an integrated system environment supporting automated metadata capture and re-use for a The first stage of the CRKM project involves the construction of a 'proof of concept' prototype to

to evolving understandings of user needs and their interaction with technologies. (Martin 2003) methods which attempt to develop a complete specification upfront, this approach is more responsive old ones as the prototype evolves and insights develop. Unlike traditional systems development iterations. Adopting this agile approach to systems development generates new ideas and re-prioritises of experts to extend existing software and metadata deployment functionality in small, user-centred meta-tools. The aim is for the CRKM researchers to work closely with a programmer and a focus group metadata across these boundaries as well as exploration of the design and functionality of supporting domains and through time. manages move from one application to another in complex intranet and Internet environments, across the business transactions, records, information objects and resources that the metadata describes and extended and integrated using scripting languages, to enable metadata to be re-used and value-added as employing user-centred and rapid prototyping techniques. Existing office and workflow tools will be for subsequent re-use across applications for multiple purposes. It will be developed iteratively captured through a mixture of automated and manual processes in particular application environments The prototype will demonstrate how recordkeeping standards-compliant metadata can be created and This will allow investigation of issues associated with the translation of

The Scenario

engaging our audience and promoting interoperability. Consequently, we expect the prototype based on this workflow will be an important demonstrator for widely applicable to many organisations irrespective of jurisdiction or business activity conducted CRKM project, using a policy development - publishing - archiving workflow scenario, which is The National Archives of Australia will provide the test-bed for the first prototyping stage of the

recordkeeping metadata can be re-used for different purposes and in different environments: developing such resources and creation of related records. They will then investigate how the researchers will explore the creation, sourcing and capture of recordkeeping metadata in the process of genealogy and recordkeeping and guides to the collection. Using the selected scenario, the CRKM and manuals. In addition the Archives, publishes books and CD-ROMs about Australian history recordkeeping in the Australian government to more detailed information, advice, standards, guidelines The National Archives of Australia develops a range of resources from policies and strategies on

- to facilitate resource discovery as resources are published to the intranet and Internet, and
- to facilitate archival intellectual control given that the 'master copies' of these resources and records relating to their development and publication form part of the national archives.

The Prototype

integrated systems supporting automated capture and re-use of metadata. The first iteration of the evolves, and provide valuable evaluation on the business utility of metadata and on the feasibility of relevant authoritative metadata, validate specifications and iterations of the prototype as the prototype researchers by helping to establish that the workflow is correctly identified and documented, source and specifications that will inform the iterative prototyping work. The focus group will assist CRKM analysis national standard, CRKM researchers will derive recordkeeping and metadata requirements Working with a focus group from the National Archives and guided by the Australian work process

building on this work. project may demonstrate translation of a few elements across the standards with subsequent iterations concept is possible. For example, looking at the underlying metadata standards for the prototype, the will examine automated capture and re-use on a very small scale to demonstrate that the

developed using the OHRM' system of the Australian Science and Technology Heritage Centre metadata from the archival control system to a higher level gateway to archival resources, such as those management systems to the environment, and extending the scenario to involve the translation of envisaged that subsequent iterations of the prototype may involve adding the functionality of content TRIM, and will simulate an archival control system using Tabularium rather than RecordSearch. It is will be based in this business application environment, but will using the most current version of archives and intellectually controlled by RecordSearch*. The proof-of-concept demonstrator prototype 'Masters' of these resources and related records will also be transferred to form part of the national management system. Resources are published to the public website and internally to the intranet. applications, such as MS Word and Outlook. Records are captured and managed in a TRIM records environment of the National Archives. There policies are developed using desktop authoring The prototype's simulation of systems and records will be derived from the business application

Implementation Model

to systems development taken in the prototyping stage. the implementation of the prototype at the test-bed site, extending the user-centred, iterative approach across multiple organizations. This stage will include specification of the functional requirements for the context of a single organisation and the context of the performance of a single function or activity provide a model for best practice. Two different contexts for implementing the prototype will be used The second stage of the project will involve implementing the prototype in a real world test-bed site to

Meta-registries and Meta-tools

metadata can be re-used for different business purposes and in compliance with different standards extended to enable translation of metadata between the different metadata schemas in use so that by the different business applications used in the scenario and test-bed site. Its functionality will be registry will be built to document and describe the different metadata standards or schemas employed both the prototyping and implementation modelling stages. A working model of a mini metadata Prototypes of tools for metadata translation and deployment will be developed or adapted to support

semantic web technologies. how these mappings can be represented for automated processing will follow, in the first instance in the involve rules for the aggregation of data or for making contextual metadata explicit. Investigation of mappings between metadata schemas and metadata held in business systems will also be developed. as well as related work undertaken in the InterPARES 2 project and at the San Diego Super Computer investigated, drawing on the outcomes of recent data modelling, representation and syntax initiatives, form of machine processable crosswalks, and then through iterative study of the suitability of emerging Depending on the boundaries across which these translations will need to occur, these mappings may Center, as described below. Mappings between the attribute and value spaces of metadata schema and In developing the registry, representations of metadata schemas in machine processable forms will be

explore how recordkeeping metadata compliant with the Recordkeeping Metadata Standard for (http://www.dstc.edu.au/Products/metaSuite/) as the means of supporting metadata interchange; and experiment with the HotMeta suite developed by the Distributed Systems Technology Centre Commonwealth Agencies can be re-used as resource discovery metadata compliant with the AGLS consequently, additional tools will be developed to support this functionality. The prototype will During development of the proof-of-concept demonstrator prototype, the project will examine and
