

**Supplemental Figure S1. Expression of Shh pathway genes in cultured medulloblastoma cells.** Total RNA (10 µg) was analyzed by northern blotting using antisense probes for *Gli1*, *Ptc1*, *Ptc2*, *Sfrp1* and *Smo* as indicated. Ethidium bromide staining of the 28S and 18S rRNA is shown as a loading control. MB, medulloblastoma from *Ptc1*<sup>+/−</sup> mouse.

**Supplemental Table 1.** The gene expression profiles of 18 samples (4 medulloblastoma tumors, 4 medulloblastoma cell cultures, 7 culture derived allografts and 3 direct allografts) were analyzed by cDNA microarray analyses. After normalization, each dataset was compared with all other samples. To identify changes in gene expression for each comparison, the numbers of probe sets scored as overexpressed (log ratio  $>1$ ) and underexpressed (log ratio  $<1$ ) were counted. The ratios of differentially expressed probe sets (including both over expressed and underexpressed probe sets) were also shown. Similar ratios (13-19%) of probe sets were differentially expressed in all “tumor versus direct allograft” comparisons (highlighted cells), and these ratios were similar to those of “tumor versus tumor” comparisons (17-21%).

The lists of pathway related genes were downloaded from the NETAFFX ANALYSIS CENTER website (<http://www.affymetrix.com/analysis>). The numbers of differentially overexpressed (log ratio  $>1$ ) and underexpressed (log ratio  $<1$ ) probe sets were counted for each comparison (direct allograft over tumor, culture over tumor, and culture-derived allograft over culture).

\* Total number of probe sets in each gene list

<sup>†</sup> Ratio of differentially expressed probe sets (including both overexpressed and underexpressed probe sets)
