

Boni et al, supplementary figure 1

Supplementary figure 1. Induction of MDA expression in melanoma cell lines after MAPK pathway inhibition is associated with decrease in phospho-ERK. Melanoma cell lines were treated with U0126 (10uM) or PD0325901 (0.2 uM) or with PLX4720 (1uM) and phospho-ERK protein level was assessed by western blot. As a control total ERK level protein level was measured. Experiments were repeated at least 3 times with similar results.
