#### Abstract

The histone deacetylases (HDACs) occur in 11 different isoforms, and these enzymes regulate the activity of a large number of proteins involved in cancer initiation and progression. The discovery of isoform selective HDAC inhibitors (HDACIs) is desirable, as it is likely that such compounds would avoid some of the undesirable side effects found with the first generation inhibitors. A series of HDACIs previously reported by us were found to display some selectivity for HDAC6 and to induce cell cycle arrest and apoptosis in pancreatic cancer cells. In the present work, we show that structural modification of these isoxazole-based inhibitors leads to high potency and selectivity for HDAC6 over HDAC1-3 and HDAC10, while unexpectedly abolishing their ability to block cell growth. Three inhibitors with lower HDAC6 selectivity inhibit the growth of cell lines BxPC3 and L3.6pl, and they only induce apoptosis in L3.6pl. We conclude that HDAC6 inhibition alone is insufficient for disruption of cell growth, and that some degree of class 1 HDAC inhibition is required. Moreover, the highly selective HDAC6Is reported herein that are weakly cytotoxic may find use in cancer immune system reactivation.

## Graphical abstract

[^0]

High or low selectivity: A new class of HDAC inhibitors bearing an isoxazole ring show high potency and selectivity for HDAC6 over HDAC1-3 and HDAC10, while unexpectedly showing little potency in blocking cell growth. These results suggest that HDAC6 inhibition alone is insufficient for disruption of cell growth, and that some degree of class 1 HDAC inhibition is required. The highly selective HDAC6I reported herein that are weakly cytotoxic may find use in cancer immune system reactivation

## Keywords

histone deacetylase inhibitors; hydroxamic acids; HDAC6 selectivity; pancreatic cancer; immune activation

## Introduction

Histone acetylation is an important determinant of chromatin organization and gene expression, with the hyperacetylation of histones being associated with "open" euchromatic states of chromatin and hypoacetylation with a "closed" heterochromatic state. ${ }^{[1,2]}$ Although the nuclear histones were identified as the initial target of the HDACs, it was discovered that some HDACs are also located in the cytoplasm where they are involved in the deacetylation of non-histone substrates including PCAF, p300, MyoD, p53, STAT3, p65 (NFкB), HSP90, and a-tubulin. ${ }^{[3]}$ There are four classes of HDACs comprised of 18 different enzymes with a highly conserved catalytic domain. Class I HDACs are homologs of the yeast histone deacetylase RPD3 and are represented by HDAC1-3 and HDAC8; Class II HDACs (HDAC4-7, HDAC9, and HDAC10) share homology with the yeast histone deacetylase HDAC1; Class III HDACs are closely related to the NAD-dependent yeast Sir2 protein and are not affected by inhibitors of other HDACs; and the most recently described HDAC11 is the sole member of the Class IV HDACs. ${ }^{[2,4]}$ HDACs exist in large multimolecular complexes and are recruited to promoter regions of genes in conjunction with other proteins. The acetylation status of histone and non-histone proteins has a wide range of effects on cellular function. In addition to influencing transcriptional activation and the DNA binding affinity of several transcriptional factors, acetylation also affects protein expression, stability, and degradation, and protein-protein interactions within the cell or nucleus. ${ }^{[5]}$ For example, acetylation of a-tubulin results in the stabilization of microtubules, an event not conducive to microtubule reorganization, and acetylation of HSP90 inhibits its ATP-binding and chaperone association with its client proteins, including many proteins that are required for maintenance of cellular transformation. ${ }^{[6]}$ The aberrant activation of HDACs in cancer has been suggested to be involved in the epigenetic silencing of tumor suppressor genes. ${ }^{[1 a, 7]}$ Yet it is clear that based on their regulatory roles for non-histone targets, the effect of

HDACs in cancer goes far beyond the modulation of histone acetylation and gene expression. Consequently, there have been many efforts to develop HDAC inhibitors (HDACIs) and to investigate their effects on cancer cell growth. Several classes of HDACIs have been found to have potent antitumor activities, with some showing selectivity between cancer cells and normal cells. ${ }^{[8]}$ Most of the known HDACIs are pan-inhibitors, therefore, the identification of compounds showing isoform selectivity is crucial to developing better tools for studying underlying mechanisms in different cancer cell lines. Previously, we have generated several series of HDACIs (Chart 1). ${ }^{[9]}$ Treatment of pancreatic cancer cells with these compounds results in a G1 and/or G2 arrest and induction of apoptosis. In addition, our data indicated that some of these HDACIs cause loss of the DNA damage checkpoint kinase, Chk1, a known HSP90 client protein. ${ }^{[10]}$ Our isozyme analysis indicates that some of these inhibitors, such as compounds $\mathbf{A - C}$, show low nM potency toward HDAC6 and HDAC3 in vitro. Our objective was to increase the selectivity index in favor of HDAC6 by applying some simple modifications to the scaffold of these lead compounds that would not significantly affect their molecular properties. Such isoform-selective agents should be valuable tools in linking specific HDAC isoforms to tumorigenic activity, especially considering the number of controversial reports on the role of HDAC6-selective inhibitors in cancer. ${ }^{[11]}$

## Results and Discussion

## Synthesis of HDAC6-selective inhibitors

With the goal to improve selectivity of the previously synthesized ligands ${ }^{[9 \mathrm{a}, 9 \mathrm{c}, 12]}$ toward HDAC6, we designed new series of compounds with consideration of the unique features of the HDAC6 binding site. ${ }^{[13]}$ The general structure of these inhibitors consists of a hydroxamic acid function as a zinc-binding group (ZBG) attached to an isoxazole or benzene ring incorporated in the linker, and a "cap" group, which in the present work is a heteroaryl group bearing additional functionality. The choice of the terminal motifs was based on HDAC inhibitors previously explored by us. ${ }^{[9 b, 9 \mathrm{c}, 13]}$ The synthesis of compounds $\mathbf{1 - 5}$ is outlined in Scheme 1. Employing a standard procedure, ${ }^{[9 \mathrm{c}]} 4$-phenylthiazol-2-ylamine (19a) and its $m$ - and $p$-nitrophenyl derivatives ( $\mathbf{1 9 b}, \mathbf{c}$ ) were coupled with either 5-hexynoic acid (20a) or 4-pentynoic acid (20b) to provide corresponding amides 21. The acetylenic function in 21a,b was transformed to isoxazole (compounds 23a,b) by 1,3-dipolar cycloaddition with a nitrile oxide generated in situ from ethyl chlorooximinoacetate and a base. ${ }^{[14]}$ The intermediates 21c,d were reduced to the aniline derivatives 22a,b, which after treatment with ethyl chloroformate or di-tert-butyl dicarbonate to provide corresponding carbamates, were converted to the isoxazoles $\mathbf{2 3 c}-\mathbf{e}$. Lastly, reaction of $\mathbf{2 3}$ with freshly prepared hydroxylamine ${ }^{[15]}$ generated the desired hydroxamic acids $\mathbf{1 - 5}$.

The second series consisting of compounds 6-12 was prepared according to Scheme 2. Coupling of 5-arylisoxazole-3-carboxylic acids 24a-c with butynylamine provided acetylenes $\mathbf{2 5 a} \mathbf{- c},{ }^{[9 b]}$ and the same procedure as outlined above was followed to generate esters 26a-c. Deprotection and subsequent acylation of the amino group of $\mathbf{2 7}$ with pivaloyl, cyclohexanecarbonyl, and benzoyl chlorides, respectively, provided intermediate esters 28ac. Hydroxamate formation yielded the target compounds 6-12.A small set of compounds
containing a benzene ring in the linker was synthesized as shown in Scheme 3. The precursor acids 24a,b were coupled with methyl 4-(aminomethyl)benzoate in the presence of PyBOP to provide esters $\mathbf{2 9} \mathbf{a}, \mathbf{b}$, which were further transformed into hydroxamates $\mathbf{1 3}$ and 14. Alternatively, the tert-butoxycarbonyl group was removed, and the resulting amines $\mathbf{3 0 a}, \mathbf{b}$ were acylated with cyclohexanecarbonyl chloride. A two-step procedure was employed to convert intermediate esters 28a,b into the corresponding hydroxamic acids $\mathbf{1 5}$ and 16 (Scheme 3). Carbazole (32) was alkylated with propargyl bromide, and the standard reaction sequence was applied to afford compound 17 (Scheme 3). The carbazole-based analog 18 with an elongated linker was made by coupling an intermediate acid formed from the ester 33 with methyl 4-(aminomethyl)benzoate, followed by the aminolysis of the methyl ester with hydroxylamine.

## HDAC isoform inhibition

All compounds were tested against both Class I (1, 2, and 3) and Class II (6 and 10) HDACs, and their $\mathrm{IC}_{50}$ values are listed in Table 1. We first looked at effects of the linker length on isozyme selectivity. In the phenylthiazole series, compound $\mathbf{2}$ exhibiting an $\mathrm{IC}_{50}$ at HDAC6 of 31 nM , was found to be somewhat more potent than its longer-chain homologs, such as compound $\mathbf{1}\left(\mathrm{IC}_{50} 81.8 \mathrm{nM}\right)$ and the previously reported compound $\mathbf{A}\left(\mathrm{IC}_{50} 67.7 \mathrm{nM}\right)$. However, the shorter linker also resulted in increased potency at HDAC3 and HDAC10. In light of previously published results, the introduction of functional groups, such as NH-Boc and NH-COOEt, either in meta or para position of the benzene ring was hoped to increase the selectivity of these compounds, possibly due to the formation of additional hydrogen bonds with the enzyme. We therefore synthesized ligands 3-12. The introduction of either of the aforementioned groups in para position resulted in a twofold improvement in potency (compounds $\mathbf{3}$ and $\mathbf{4}, \mathrm{IC}_{50}$ at HDAC6 41.2 and 48.9 nM , respectively). However, selectivity against HDAC10 was diminished (HDAC10/6 selectivity ratio 1.0 and 6.6 , respectively). On the contrary, the meta-(ethoxycarbonyl)amino substituent bestows significant selectivity on the inhibitor 5. In the bis-isoxazole series, ligands 6 and 7 were equipotent at HDAC6, with the meta-NH-Boc substituted analog 7 being more selective against Class 1. Surprisingly, replacement of the Boc group by ethoxycarbonyl was found to be deleterious for activity ( $\mathbf{8}$ $v s 6)$.

Next, we chose to investigate the incorporation of other bulky, electron-withdrawing substituents at an amino group in meta position, and synthesized compounds $\mathbf{9 - 1 2}$ (Table 1). In ligand 10, the single-bonded oxygen is deleted, resulting in an amide rather than a urethane function. This replacement caused little reduction of potency or selectivity ( $\mathrm{IC}_{50}$ at HDAC6 21.2 nM , selectivity index (SI) at least 1900). Compound 9 , bearing a free amino group, was reasonably active at HDAC6, but less selective over all other isoforms. Compound $\mathbf{1 1}$ containing a (cyclohexanecarbonyl)amino group showed equal potency to that of the NH-Boc analog 7. Within this series, the benzoyl-substituted analog $\mathbf{1 2}$ was identified as the most potent HDAC6 inhibitor with an acceptable selectivity profile.

Because most of the hydroxamate-based HDACIs are very polar (i. e., have low CLogP values, which could affect cell permeability), we decided to increase their lipophilicity by replacing the heterocycle in the linker with a benzene ring. These structural alterations
resulted in ligands $\mathbf{1 3}$ and $\mathbf{1 4}$, which stand out through their picomolar activity at HDAC6 and a selectivity of more than 3 orders of magnitude over HDAC2 and HDAC10, and at least 400 -fold selectivity over HDAC1 and HDAC3. These compounds have a higher CLogP value (2.66) compared with their isoxazole analogs 6 and 7 ( $\mathrm{CLog} \mathrm{P}=1.35$ ). Compounds $\mathbf{1 5}$ and $\mathbf{1 6}$ were as potent as $\mathbf{6}$ and $\mathbf{7}$ at HDAC6, but had relatively low SIs. Lastly, the effect of replacement of the amidophenyl group by a more rigid and bulkier substituent, such as carbazole, on the pattern of isozyme selectivity was studied. The isoxazolylhydroxamate $\mathbf{1 7}$ was found to be a weak inhibitor at all isozymes tested. On the other hand, the elongated phenylhydroxamate 18 retained the HDAC6 potency of its meta-BocNH substituted analog 14, and showed an improved selectivity over HDAC10.

The selectivity profile of HDACI 6 was more closely evaluated (Table S1 in the supporting information). This compound was found to be highly selective for HDAC6 over all other isoforms.

## Growth inhibition of pancreatic cancer cells by new HDACls

Several HDACIs from different series, demonstrating varying potencies and selectivity profiles in the isozyme assays, were examined for their capacity to decrease pancreatic cancer cell viability (Table 2). Previously, it has been shown that treatment of BxPC3, Panc04.03 and MiaPaCa-2 cells with HDACIs A-C led to a significant decrease in pancreatic cancer cell viability. ${ }^{9 b,}{ }^{9 \mathrm{c}}$ Some of our new HDACIs listed in Table 2, such as $\mathbf{1}$, $\mathbf{2}, \mathbf{4}$, and $\mathbf{5}$ showed antitumor activity similar to the reference compound $\mathbf{C}$ when tested in two pancreatic cancer cell lines, BxPC3 and L3.6pl. HDACIs 1, 2, 4, and 5 demonstrated reasonable growth inhibition in at least one cancer cell line at low-micromolar concentrations, whereas the majority of the more selective HDAC6 inhibitors showed weak antiproliferative effects with $\mathrm{GI}_{50}$ values above $50 \mu \mathrm{M}$ (Table 2). However, exceptions were seen with compound $\mathbf{1 3}$ that had $\mathrm{GI}_{50}$ values of $8 \mu \mathrm{M}$ and $2 \mu \mathrm{M}$ in BxPX3 and L3.6pl, and compound $\mathbf{1 8}$ that had $\mathrm{GI}_{50}$ values of $2.3 \mu \mathrm{M}$ and $1.3 \mu \mathrm{M}$ in BxPX 3 and L 3.6 pl, respectively (Table 2).

Moreover, compounds 1, 2, and 4 effectively induced apoptosis as determined by Hoechst staining and PARP cleavage, a marker of apoptosis, in HDACI-treated L3.6pl pancreatic cancer cells 24 hours after the initiation of treatment (Figure 1). On the other hand, none of compounds 1, 2, or $\mathbf{4}$ induced apoptosis in BxPC 3 pancreatic cancer cells (data not shown). It is worth noting that the nonselective HDACI, panobinostat, has recently been found to promote apoptosis and reduce tumor growth in the BxPC3 subcutaneous xenograft mouse model. ${ }^{[16]} \mathrm{L} 3.6 \mathrm{pl}$ is characterized as a poorly differentiated, fast-growing pancreatic cell line with high tumorigenicity, while BxPC 3 is characterized as more differentiated, slowgrowing cell line with low tumorigenicity. Our results suggest that selection of HDACIs as effective pancreatic cancer therapies will likely depend on the precise histopathological features of the tumor.

## Selective HDAC6 inhibitors do not suppress pancreatic cancer cell migration

Previous studies suggested that levels of HDAC6 but not its deacetylase activity affect both cell migration and cytotoxicity. ${ }^{[17]}$ To gain a better understanding of the utility and
selectivity of HDAC6 inhibitors, PANC1 pancreatic cancer cells were treated with a panel of the new HDAC6-selective inhibitors, and with the non-selective inhibitors $\mathbf{B}$ and $\mathbf{C}$ for comparison. We demonstrated that treatment with either group leads to an accumulation of acetylated a-tubulin, a well-known target of HDAC6 (Figure 2A). ${ }^{[18]}$ Pancreatic cancer cell migration was measured using the scratch-wound assay. Importantly, we found that compounds $\mathbf{B}$ and $\mathbf{C}$ demonstrated a significant reduction in PANC1 cell migration in this assay, compared to diluent-treated control cells (Figure 2B and Table 3). On the other hand, the HDAC6-selective inhibitors 6, 9-13, and $\mathbf{1 8}$ had only a minor effect on pancreatic cancer cell migration, in contrast to what has previously been reported for tubacin. ${ }^{[19]}$

In summary, we have demonstrated that simple structural alterations, such as the incorporation of a rigid aromatic ring into the linker and the introduction of a functional group in the cap residue, can be used to improve selectivity toward the HDAC6 isoform in this series of compounds. We were able to generate compounds possessing low-nanomolar to sub-nanomolar potency and high HDAC6 selectivity. Among those tested, the most selective compounds demonstrated only low antiproliferative activity against pancreatic cancer cell lines as compared to their non-selective analogs. Treatment of pancreatic cancer cells with the newly synthesized HDACIs leads to an accumulation of acetylated a-tubulin, but does not affect cell migration.

## Conclusions

In conclusion, while inhibition of Class 1 HDACs has been proven to be essential for reducing the viability of pancreatic cancer cells, the HDAC6 contribution to pancreatic cancer cell viability remains to be investigated. However, the low growth inhibition induced by some of these compounds may make them more valuable as adjuvants in reactivation of the immune system through control of the expression levels of PD-L1. ${ }^{[20]}$ This possibility is currently under study.

## Experimental Section

All reactions were conducted under an argon atmosphere and stirred magnetically. Starting materials, reagents, and solvents were purchased from commercial suppliers and used without further purification unless otherwise stated. Microwave-assisted reactions were run in a Biotage Initiator microwave synthesizer. Unless stated otherwise, ${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ NMR spectra were recorded on Bruker DPX-400 or AVANCE- 400 spectrometers at 400 MHz and 100 MHz , respectively, with TMS as an internal standard. Standard abbreviations indicating multiplicity were used as follows: $\mathrm{s}=$ singlet, $\mathrm{d}=$ doublet, $\mathrm{t}=$ triplet, $\mathrm{q}=$ quadruplet, $\mathrm{m}=$ multiplet, and $\mathrm{br}=$ broad. Mass spectra were measured in the ESI mode at an ionization potential of 70 eV with an LC-MS containing a Hewlett-Packard MSD. Analytical TLC was performed on Merck $60 \mathrm{~F}_{254}$ silica gel glass plates, layer thickness $250 \mu \mathrm{~m}$. Preparative TLC was performed on Analtech silica gel GF plates, layer thickness 1 mm . For flash chromatography, silica gel of 230400 mesh particle size was used. Analytical HPLC was carried out on an ACE $3 \mathrm{AQ} \mathrm{C}_{18}$ column $(150 \times 4.6 \mathrm{~mm}$, particle size $3 \mu \mathrm{~m}$; flow rate $=2.0$ $\mathrm{mL} / \mathrm{min}$; from $10 \%$ acetonitrile in water to $50 \%$ in 10 min and to $100 \%$ acetonitrile in 5 min ,
both solvents containing $0.05 \%$ TFA (Method A), or from 30\% acetonitrile in water to $100 \%$ acetonitrile in 15 min , both solvents containing $0.05 \%$ TFA (Method B)).

## General Procedures for Amide Coupling

Method A—To a solution of an aminothiazole (1 eq) and a carboxylic acid (1.1 eq) in dry $\mathrm{CH}_{2} \mathrm{Cl}_{2}(10 \mathrm{~mL} / \mathrm{mmol})$ at ambient temperature were added EDCI ( 1.5 eq ) and DMAP ( 0.1 eq), and the resulting reaction mixture was stirred for 12 h . Upon reaction completion as indicated by TLC, the reaction mixture was diluted with 50 mL of $\mathrm{CH}_{2} \mathrm{Cl}_{2}$, and then washed with saturated aqueous $\mathrm{NaHCO}_{3}(50 \mathrm{~mL})$ and brine $(50 \mathrm{~mL})$, dried over anhydrous $\mathrm{Na}_{2} \mathrm{SO}_{4}$, and concentrated under vacuum. The residue was purified by flash chromatography to afford the product.

Method B-To a mixture of 4-(3- or 4-nitrophenyl)thiazol-2-ylamine (1 eq) and 5hexynoic acid ( 1 eq ) in anhydrous pyridine ( $4 \mathrm{~mL} / \mathrm{mmol}$ ) at $-15^{\circ} \mathrm{C}$ was added phosphorus oxychloride ( 1 eq ) dropwise with vigorous stirring. After 45 min of stirring at $-15{ }^{\circ} \mathrm{C}$, the reaction mixture was allowed to warm to ambient temperature, heated for 1 h at $60^{\circ} \mathrm{C}$, and stirred overnight at ambient temperature. The reaction was quenched by addition of ice water, and the mixture was extracted with EtOAc ( 3 X 50 mL ). The organic layer was washed with brine $(50 \mathrm{~mL})$, dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$, and concentrated under vacuum. The residue was purified by CombiFlash chromatography (EtOAc - hexane; 25\% to $40 \%$ ) to provide the amide.

Method C—To a solution of the carboxylic acid (1 eq) in DMF ( $0.5 \mathrm{~mL} / \mathrm{mmol}$ ) was added $\operatorname{PyBOP}(1 \mathrm{eq})$, and the mixture was stirred for 20 min at ambient temperature. But-3ynylamine hydrochloride ( 1.05 eq ) and $\mathrm{Et}_{3} \mathrm{~N}$ ( 3 eq ) were added subsequently, and the reaction mixture was stirred for 1 h . Upon completion of the reaction as ascertained by TLC, $\mathrm{Et}_{3} \mathrm{~N}$ was evaporated, and the residue was purification by HPLC.

## General Procedure for the 1,3-Dipolar Cycloaddition with a Nitrile Oxide (Method D)

To a stirred solution of an acetylene ( 1 eq ) and $\mathrm{Et}_{3} \mathrm{~N}$ ( 15 eq ) in dry THF ( $15 \mathrm{~mL} / \mathrm{mmol}$ ) at ambient temperature was added dropwise over 36 h by syringe pump a solution of ethyl chlorooximinoacetate ( 15 eq ) in 20 mL of THF. The white solids formed were separated by filtration and washed with ethyl acetate ( 200 mL ). The combined organic phases were concentrated under vacuum. The residue was purified by column chromatography.

## General Procedure for Hydroxamic Acid Formation (Method E)

To a stirred solution of the ester $(0.1 \mathrm{~g}, 1 \mathrm{eq})$ in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(15 \mathrm{~mL} / \mathrm{mmol})$ was added at $0{ }^{\circ} \mathrm{C}$ a freshly prepared solution of $\mathrm{NH}_{2} \mathrm{OH}$. After 15 min , the reaction mixture was diluted with 30 mL of $\mathrm{CH}_{2} \mathrm{Cl}_{2}$, and the product was extracted into $\mathrm{H}_{2} \mathrm{O}$. The water phase was acidified with 1 N HCl to pH approx. 4. The precipitate was filtered off and washed with $\mathrm{H}_{2} \mathrm{O}$ and hexane to give the hydroxamic acid, which was purified by HPLC.

Preparation of $\mathrm{NH}_{2} \mathrm{OH}$ : To a stirring solution of $\mathrm{NH}_{2} \mathrm{OH} . \mathrm{HCl}(1.0 \mathrm{~g}, 10 \mathrm{wt}$. eq) in MeOH $(10 \mathrm{~mL})$ was added portionwise at $0^{\circ} \mathrm{C}$ a solution of $\mathrm{KOH}(1.0 \mathrm{~g})$ in $\mathrm{MeOH}(4.0 \mathrm{~mL})$. The
resulting mixture was filtered, and the obtained solution of $\mathrm{NH}_{2} \mathrm{OH}$ in MeOH was used in a reaction with an ester.

## General Procedure for the Reduction of Nitro Groups (Method F)

A mixture of the nitro compound (1 eq) and $\mathrm{NH}_{4} \mathrm{Cl}(2 \mathrm{eq})$ in $\mathrm{H}_{2} \mathrm{O}-\mathrm{EtOH}(3: 5,17 \mathrm{~mL} / \mathrm{mmol})$ was heated to reflux, and iron filings $(9 \mathrm{eq})$ and $\mathrm{AcOH}(1 \mathrm{~mL} / \mathrm{mmol})$ were added subsequently. The reaction mixture was refluxed for 2 h , and then allowed to cool to ambient temperature. It was diluted with $\mathrm{EtOAc}(100 \mathrm{~mL})$, washed with $\mathrm{H}_{2} \mathrm{O}(40 \mathrm{~mL})$ and brine ( 40 mL ), dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$, and evaporated. The residue was purified by CombiFlash chromatography.

N-(4-Phenylthiazol-2-yl)pent-4-ynamide (21b)—General Procedure A was used to couple 2-amino-4-phenylthiazole (19a) ( $1.01 \mathrm{~g}, 5.67 \mathrm{mmol}$ ) and 4-pentynoic acid (20b) $(0.61 \mathrm{~g}, 6.24 \mathrm{mmol})$. The residue was purified by column chromatography ( EtOAc - hexane; $30 \%)$ to afford $21 \mathrm{~b}(1.24 \mathrm{~g}, 85 \%) .{ }^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ): $\delta=2.20(\mathrm{~m}, 2 \mathrm{H}), 2.40(\mathrm{~m}$, $2 \mathrm{H}), 7.18(\mathrm{~s}, 1 \mathrm{H}), 7.38-7.47(\mathrm{~m}, 3 \mathrm{H}), 7.85(\mathrm{~m}, 2 \mathrm{H}), 11.24(\mathrm{~s}, 1 \mathrm{H}) ;{ }^{13} \mathrm{C}$ NMR ( 100 MHz , $\left.\mathrm{CDCl}_{3}\right): \delta=14.0,34.4,69.4,82.0,108.0,126.3,128.3,128.9,134.2,149.7,169.2$.

## 5-[2-[ $N$-(4-Phenylthiazol-2-yl)carbamoyl]ethyl]isoxazole-3-carboxylic Acid

 Ethyl Ester (23b)-The title compound was synthesized from $\mathbf{2 1 b}$ ( $0.56 \mathrm{~g}, 2.18 \mathrm{mmol}$ ) and ethyl chlorooximinoacetate ( $4.92 \mathrm{~g}, 32.7 \mathrm{mmol}$ ) according to General Procedure D. The residue was purified by column chromatography ( EtOAc - hexane; 25\% to 50\%).Crystallization from $10 \% \mathrm{EtOAc}$ - hexane provided the pure ester $\mathbf{2 3 b}(0.41 \mathrm{~g}, 50 \%) .{ }^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ): $\delta=1.44(\mathrm{t}, J=8.0 \mathrm{~Hz}, 2 \mathrm{H}), 2.21(\mathrm{t}, J=8.0 \mathrm{~Hz}, 3 \mathrm{H}), 2.93(\mathrm{t}, J=$ $8.0 \mathrm{~Hz}, 2 \mathrm{H}), 4.45(\mathrm{q}, J=8.0 \mathrm{~Hz}, 2 \mathrm{H}), 6.14(\mathrm{~s}, 1 \mathrm{H}), 7.17(\mathrm{~s}, 1 \mathrm{H}), 7.28-7.43(\mathrm{~m}, 3 \mathrm{H}), 7.49(\mathrm{~d}$, $J=8 \mathrm{~Hz}, 2 \mathrm{H})(\mathrm{m}, 2 \mathrm{H}), 12.18(\mathrm{~s}, 1 \mathrm{H}) ;{ }^{13} \mathrm{C}$ NMR ( $100 \mathrm{MHz}, \mathrm{CDCl} 3$ ): $\delta=14.1,21.4,32.3$, $62.1,101.9,108.3,126.4,128.6,129.0,134.2,149.5,156.2,159.9,150.0,168.9,172.9$.

5-[2-[N-(4-Phenylthiazol-2-yl)carbamoyl]ethyl]isoxazole-3-carbohydroxyamic
Acid (2)—The title compound was synthesized from the ester 23b ( $0.10 \mathrm{~g}, 0.27 \mathrm{mmol}$ ) according to General Procedure E. Yield: $0.05 \mathrm{~g}, 50 \%$. A sample for biological testing was purified by HPLC. ${ }^{1} \mathrm{H}$ NMR ( $\left.400 \mathrm{MHz},\left[\mathrm{D}_{6}\right] \mathrm{DMSO}\right): ~ \delta=2.92(\mathrm{t}, J=7.2 \mathrm{~Hz}, 2 \mathrm{H}), 3.16(\mathrm{t}, J$ $=7.2 \mathrm{~Hz}, 3 \mathrm{H}), 6.58(\mathrm{~s}, 1 \mathrm{H}), 7.31-7.45(\mathrm{~m}, 3 \mathrm{H}), 7.90(\mathrm{~d}, J=7.4 \mathrm{~Hz}, 2 \mathrm{H}), 9.35(\mathrm{~s}, 1 \mathrm{H}), 11.49$ (s, 1H), $12.38(\mathrm{~s}, 1 \mathrm{H}) ;{ }^{13} \mathrm{C}$ NMR (100 MHz, [D $\left.\left.{ }_{6}\right] \mathrm{DMSO}\right): ~ \delta=21.8,31.1,32.5,191.1,108.4$, 126.0, 128.2, 129.1, 134.7, 149.2, 156.6, 157.9, 158.1, 170.1, 173.8; HPLC purity: 97.4\%; HRMS-FAB: $m / z[M+H]^{+}$calcd for $\mathrm{C}_{16} \mathrm{H}_{14} \mathrm{~N}_{4} \mathrm{O}_{4} \mathrm{~S}: 359.0808$, found: 359.0820.

## 5-[2-[N-(4-Phenylthiazol-2-yl)carbamoyl]propyl]isoxazole-3-carboxylic Acid

 Ethyl Ester (23a)—The title compound was synthesized from 2-amino-4-phenylthiazole according to General Procedures A and D in $32 \%$ yield over two steps. ${ }^{1} \mathrm{H}$ NMR $(400 \mathrm{MHz}$, $\left.\mathrm{CDCl}_{3}\right): \delta=1.41(\mathrm{t}, J=8.0 \mathrm{~Hz}, 2 \mathrm{H}), 1.96-2.03(\mathrm{t}, J=8.0 \mathrm{~Hz}, 3 \mathrm{H}), 2.93(\mathrm{~m}, 2 \mathrm{H}), 2.21(\mathrm{t}, J=$ $7.5 \mathrm{~Hz}, 2 \mathrm{H}), 2.71(\mathrm{t}, J=7.5 \mathrm{~Hz}, 2 \mathrm{H}), 4.46(\mathrm{q}, J=8.0 \mathrm{~Hz}, 2 \mathrm{H}), 6.30(\mathrm{~s}, 1 \mathrm{H}), 7.34(\mathrm{~s}, 1 \mathrm{H})$, $7.36-7.47$ (m, 3H), 7.84 (d, $J=8.4 \mathrm{~Hz}, 2 \mathrm{H}), 10.62(\mathrm{~s}, 1 \mathrm{H})$.5-[3-[N-(4-Phenylthiazol-2-yl)carbamoyl]propyl]isoxazole-3-carbohydroxamic
Acid (1)—The title compound was synthesized from the ester $\mathbf{2 3 a}(0.10 \mathrm{~g}, 0.27 \mathrm{mmol})$ according to General Procedure E and purified by HPLC (Method A). Yield: ( 0.053 g , $54 \%) .{ }^{1} \mathrm{H}$ NMR ( $\left.400 \mathrm{MHz},\left[\mathrm{D}_{6}\right] \mathrm{DMSO}\right): \delta=2.02(\mathrm{~m}, 2 \mathrm{H}), 2.54(\mathrm{t}, J=7.4 \mathrm{~Hz}, 2 \mathrm{H}), 2.86(\mathrm{t}$, $J=7.4 \mathrm{~Hz}, 3 \mathrm{H}), 3.30(\mathrm{br} \mathrm{s}, 1 \mathrm{H}), 6.58(\mathrm{~s}, 1 \mathrm{H}), 7.30-7.45(\mathrm{~m}, 3 \mathrm{H}), 7.88(\mathrm{~d}, J=7.4 \mathrm{~Hz}, 2 \mathrm{H})$, $9.35(\mathrm{~s}, 1 \mathrm{H}), 12.28(\mathrm{~s}, 1 \mathrm{H}) ;{ }^{13} \mathrm{C}$ NMR ( $\left.100 \mathrm{MHz},\left[\mathrm{D}_{6}\right] \mathrm{DMSO}\right): \delta=22.8,25.7,34.3,102.3$, 108.3, 124.6, 126.0, 128.1, 129.1, 134.7, 149.1, 158.2, 171.2, 171.5; HPLC purity: $98.2 \%$; HRMS-FAB: $m / z[M+H]^{+}$calcd for $\mathrm{C}_{17} \mathrm{H}_{15} \mathrm{~N}_{4} \mathrm{O}_{4} \mathrm{~S}: 373.0965$, found: 373.0978 .

N-[4-(4-Nitrophenyl)thiazol-2-yl]hex-5-ynamide (21c)—General Procedure B was used to couple 4-(4-nitrophenyl)thiazol-2-ylamine (19b) ( $0.50 \mathrm{~g}, 2.26 \mathrm{mmol}$ ) and 5hexynoic acid (20a) ( $0.25 \mathrm{~g}, 2.26 \mathrm{mmol})$. The residue was purified by flash chromatography ( EtOAc - hexane; $25 \%$ to $40 \%$ ) to provide the acetylene $21 \mathrm{c}(0.61 \mathrm{~g}, 84 \%)$.

N-[4-(4-Aminophenyl)thiazol-2-yl]hex-5-ynamide (22a)—The title compound was obtained from the nitro compound $21 \mathrm{c}(0.61 \mathrm{~g}, 1.90 \mathrm{mmol})$ and $\mathrm{NH}_{4} \mathrm{Cl}(0.20 \mathrm{~g}, 3.8 \mathrm{mmol})$ according to General Procedure F and purified by flash chromatography (EtOAc - hexane; $30 \%$ to $50 \%$ ). Yield: $0.39 \mathrm{~g}(71 \%) .{ }^{1} \mathrm{H}$ NMR ( $300 \mathrm{MHz},\left[\mathrm{D}_{6}\right] \mathrm{DMSO}$ ): $\delta=1.75(\mathrm{~m}, 2 \mathrm{H})$, $2.20(\mathrm{~m}, 2 \mathrm{H}), 2.56(\mathrm{~m}, 2 \mathrm{H}), 2.82(\mathrm{~s}, 1 \mathrm{H}), 5.23(\mathrm{br} \mathrm{s}, 2 \mathrm{H}), 6.56(\mathrm{~d}, J=9.0 \mathrm{~Hz}, 2 \mathrm{H}), 7.16(\mathrm{~s}$, $1 \mathrm{H}), 7.53(\mathrm{~d}, J=9.0 \mathrm{~Hz}, 2 \mathrm{H}), 12.15(\mathrm{~s}, 1 \mathrm{H})$.

## 5-[3-[ $N$-[4-[4-(tert-Butoxycarbonylamino)phenyl]thiazol-2-yl]carbamoyl]propyl]isoxazole-3-carboxylic Acid Ethyl Ester (23c)

a.

Synthesis of $N$-[4-[2-(hex-5-ynoylamino)thiazol-4-yl)phenyl]carbamic acid tert-butyl ester. A mixture of the amine $\mathbf{2 2 a}(0.20 \mathrm{~g}, 0.70 \mathrm{mmol})$ and $\mathrm{Boc}_{2} \mathrm{O}(0.20 \mathrm{~g}, 0.91 \mathrm{mmol})$ in 2 mL of toluene was placed in a microwave oven and heated for 20 min at $120^{\circ} \mathrm{C}$. The solvent was evaporated, and the residue was purified by flash chromatography (EtOAc - hexane; 30\% to $50 \%$ ) to provide the intermediate urethane $(0.21 \mathrm{~g}, 79 \%) .{ }^{1} \mathrm{H}$ NMR (300 $\left.\mathrm{MHz}, \mathrm{CDCl}_{3}\right): \delta=1.25(\mathrm{~m}, 9 \mathrm{H}), 1.99(\mathrm{~m}, 2 \mathrm{H}), 2.30(\mathrm{~m}, 2 \mathrm{H}), 2.01(\mathrm{~s}, 1 \mathrm{H})$, $2.58(\mathrm{~m}, 2 \mathrm{H}), 7.05(\mathrm{~s}, 1 \mathrm{H}), 7.40(\mathrm{~m}, 2 \mathrm{H}), 7.74(\mathrm{~d}, J=9.0 \mathrm{~Hz}, 2 \mathrm{H})$.
b. The title compound $\mathbf{2 3 c}$ was synthesized from the above intermediate ( $0.21 \mathrm{~g}, 0.54 \mathrm{mmol}$ ) and ethyl chlorooximinoacetate ( $1.23 \mathrm{~g}, 8.17 \mathrm{mmol}$ ) according to General Procedure D and purified by flash chromatography (EtOAc - hexane; 25\% to 70\%). Yield: 0.12 g ( $44 \%$ ). ${ }^{1} \mathrm{H}$ NMR ( 400 MHz $\left.\mathrm{CDCl}_{3}\right): \delta=1.41(\mathrm{t}, J=7.1 \mathrm{~Hz}, 3 \mathrm{H}), 1.52(\mathrm{~s}, 9 \mathrm{H}), 1.98(\mathrm{~m}, 2 \mathrm{H}), 2.21(\mathrm{~m}$, $2 \mathrm{H}), 2.69(\mathrm{~m}, 2 \mathrm{H}), 4.44(\mathrm{q}, J=7.1 \mathrm{~Hz}, 2 \mathrm{H}), 6.37(\mathrm{~s}, 1 \mathrm{H}), 7.04(\mathrm{~s}, 1 \mathrm{H})$, $7.33(\mathrm{~m}, 2 \mathrm{H}), 7.64(\mathrm{~m}, 2 \mathrm{H}), 11.50(\mathrm{br} \mathrm{s}, 1 \mathrm{H})$.

## N-[4-[2-[4-[3-(N-Hydroxycarbamoyl)isoxazol-5-yl]butyrylamino]thiazol-4-

 yl]phenyl]carbamic Acid tert-Butyl Ester (3)—The title compound was synthesized from the ester $\mathbf{2 3 c}(0.12 \mathrm{~g}, 0.24 \mathrm{mmol})$ according to General Procedure E. Yield: 0.025 g (24.5\%). ${ }^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz},\left[\mathrm{D}_{6}\right] \mathrm{DMSO}$ ): $\delta=1.41(\mathrm{~s}, 9 \mathrm{H}), 1.93(\mathrm{~m}, 2 \mathrm{H}), 2.44(\mathrm{~m}, 2 \mathrm{H})$, $2.79(\mathrm{~m}, 2 \mathrm{H}), 6.54(\mathrm{~s}, 1 \mathrm{H}), 7.37-7.44(\mathrm{~m} 3 \mathrm{H}), 7.89(\mathrm{~d}, J=5.1 \mathrm{~Hz}, 2 \mathrm{H}), 9.37(\mathrm{~s}, 1 \mathrm{H}), 11.40$ (br s, 1H), 12.19 (s, 1H); ${ }^{13} \mathrm{C}$ NMR (100 MHz [D $\left.{ }_{6}\right]$ DMSO): $\delta=22.8,25.6,28.5,34.3,79.6$,101.1, 106.6, 118.5, 126.4, 128.7, 139.5, 149.1, 153.1, 156.6, 157.8, 158.1, 171.1, 174.3;

HPLC purity: $97.9 \%$; HRMS-FAB: $m / z[M+H]^{+}$calcd for $\mathrm{C}_{22} \mathrm{H}_{25} \mathrm{~N}_{5} \mathrm{O}_{6} \mathrm{~S}: 488.1598$, found: 488.1618.

## 5-[3-[N-[4-[4-(Ethoxycarbonylamino)phenyl]thiazol-2-yl]carbamoyl]propyl]isoxazole-3-carboxylic Acid Ethyl Ester (23d)

a.

Synthesis of $N$-[4-[2-(hex-5-ynoylamino)thiazol-4-yl]phenyl]carbamic acid ethyl ester. To a mixture of the amine 22a ( $0.18 \mathrm{~g}, 0.64 \mathrm{mmol}$ ) and $\mathrm{Et}_{3} \mathrm{~N}(0.17 \mathrm{~mL}, 1.3 \mathrm{mmol})$ in THF ( 5 mL ) was added ethyl chloroformate $(0.08 \mathrm{~g}, 0.77 \mathrm{mmol})$ at ambient temperature. The resulting mixture was stirred for 1 h . Upon completion of the reaction as ascertained by TLC, EtOAc ( 20 mL ) was added. The organic phase was washed with water ( 20 $\mathrm{mL})$ and brine $(20 \mathrm{~mL})$, dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$, and evaporated. The residue was purified by flash chromatography (EtOAc - hexane; $25 \%$ to $100 \%$ ) to provide the intermediate urethane $(0.23 \mathrm{~g}, 99 \%) .{ }^{1} \mathrm{H}$ NMR $(400 \mathrm{MHz}$, $\left.\left[\mathrm{D}_{6}\right] \mathrm{DMSO}\right): \delta=1.23(\mathrm{t}, J=7.1 \mathrm{~Hz}, 3 \mathrm{H}), 1.81(\mathrm{~m}, 2 \mathrm{H}), 2.22(\mathrm{~m}, 2 \mathrm{H}), 2.55$ (m, 2H), $2.82(\mathrm{~m}, 1 \mathrm{H}), 4.14(\mathrm{q}, J=7.1 \mathrm{~Hz}, 2 \mathrm{H}), 7.44(\mathrm{~s}, 1 \mathrm{H}), 7.52(\mathrm{~d}, J=$ $8.5 \mathrm{~Hz}, 2 \mathrm{H}), 7.77(\mathrm{~d}, J=8.5 \mathrm{~Hz}, 2 \mathrm{H}), 9.72(\mathrm{~s}, 1 \mathrm{H}), 12.2(\mathrm{~s}, 1 \mathrm{H}) ;{ }^{13} \mathrm{C}$ NMR (400 MHz, [D $\left.\mathrm{D}_{6}\right] \mathrm{DMSO}$ ): $\delta=14.9,17.7,23.9,34.1,60.6,72.2,84.2$, $106.7,118.5,126.5,129.0,139.2,149.0,153.9,158.1,171.3$.
b. The title compound $\mathbf{2 3 d}$ was synthesized from the above intermediate $(0.23 \mathrm{~g}, 0.64 \mathrm{mmol})$ and ethyl chlorooximinoacetate $(0.97 \mathrm{~g}, 6.43 \mathrm{mmol})$ according to General Procedure D and purified by flash chromatography (EtOAc - hexane; $30 \%$ to $50 \%$ ). Yield: ( $0.20 \mathrm{~g}, 65 \%$ ). ${ }^{1} \mathrm{H}$ NMR ( 400 $\left.\mathrm{MHz},\left[\mathrm{D}_{6}\right] \mathrm{DMSO}\right): ~ \delta=1.26(\mathrm{~m}, 3 \mathrm{H}), 2.01(\mathrm{~m}, 2 \mathrm{H}), 2.52(\mathrm{~m}, 2 \mathrm{H}), 2.89$ $(\mathrm{m}, 2 \mathrm{H}), 4.33(\mathrm{~m}, 2 \mathrm{H}), 6.73(\mathrm{~s}, 1 \mathrm{H}), 7.45(\mathrm{~s}, 1 \mathrm{H}), 7.49(\mathrm{~d}, J=8.5 \mathrm{~Hz}, 2 \mathrm{H})$, 7.77 (d, $J=8.5 \mathrm{~Hz}, 2 \mathrm{H}), 9.55(\mathrm{~s}, 1 \mathrm{H}), 9.72(\mathrm{~s}, 1 \mathrm{H}), 12.2(\mathrm{~s}, 1 \mathrm{H}), 13.2(\mathrm{~s}$, $1 \mathrm{H})$.

N-[4-[2-[4-[3-(N-Hydroxycarbamoyl)isoxazol-5-yl]butyrylamino]thiazol-4yl]phenyl]carbamic Acid Ethyl Ester (4)—The title compound was synthesized from the ester $\mathbf{2 3 d}(0.20 \mathrm{~g}, 0.42 \mathrm{mmol})$ according to General Procedure E. Yield: ( 0.075 g , $38 \%) .{ }^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz},\left[\mathrm{D}_{6}\right] \mathrm{DMSO}$ ): $\delta=1.25(\mathrm{t}, J=7.1 \mathrm{~Hz}, 3 \mathrm{H}), 2.02(\mathrm{~m}, 2 \mathrm{H}), 2.54(\mathrm{~m}$, $2 \mathrm{H}), 2.86(\mathrm{~m}, 2 \mathrm{H}), 4.14(\mathrm{~d}, J=7.1 \mathrm{~Hz}, 3 \mathrm{H}), 6.61(\mathrm{~s}, 1 \mathrm{H}), 7.46(\mathrm{~s}, 1 \mathrm{H}), 7.50(\mathrm{~d}, J=7.1 \mathrm{~Hz}$, 2H), 7.78 (d, $J=7.1,2 \mathrm{H}), 9.72(\mathrm{~s}, 1 \mathrm{H}), 11.48(\mathrm{~s}, 1 \mathrm{H}), 12.27(\mathrm{~s}, 1 \mathrm{H}) ;{ }^{13} \mathrm{C}$ NMR ( 100 MHz , [D ${ }_{6}$ ]DMSO): $\delta=14.9,22.8,25.7,31.1,34.2,60.6,101.1,106.8,118.5,126.5,129.0,139.2$, 149.0, 153.9, 157.9, 158.1, 171.1, 174.3; HPLC purity: 98.1\%; HRMS-FAB: $m / z[M+H]^{+}$ calcd for $\mathrm{C}_{20} \mathrm{H}_{21} \mathrm{~N}_{5} \mathrm{O}_{6} \mathrm{~S}: 460.1285$, found: 460.1300 .

## 5-[2-[N-[4-[3-(Ethoxycarbonylamino]phenyl)thiazol-2-yl]carbamoyl]ethyl]isoxazole-3-carboxylic Acid Ethyl Ester (23e)

a. Synthesis of N-[3-[2-(pent-4-ynoylamino)thiazol-4-yl]phenyl]carbamic acid ethyl ester. To a solution of the amine $\mathbf{2 2 b}(0.16 \mathrm{~g}, 0.60 \mathrm{mmol})$ and $\mathrm{Et}_{3} \mathrm{~N}(0.24 \mathrm{~mL}, 1.80 \mathrm{mmol})$ in THF ( 3 mL ) was added dropwise at $0^{\circ} \mathrm{C}$ a
solution of ethyl chloroformate ( $0.07 \mathrm{~mL}, 0.56 \mathrm{mmol}$ ) in THF ( 1 mL ). The reaction mixture was stirred for 20 min , diluted with EtOAc ( 25 mL ), washed with water ( 20 mL ), aqueous $\mathrm{NaHCO}_{3}(20 \mathrm{~mL})$, and brine (20 mL ), dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$, and evaporated. The residue was purified by preparative TLC (EtOAc - hexane; 30\%) to provide the intermediate urethane $(0.10 \mathrm{~g}, 48 \%) .{ }^{1} \mathrm{H}$ NMR ( $\left.400 \mathrm{MHz},\left[\mathrm{D}_{6}\right] \mathrm{DMSO}\right): ~ \delta=1.42(\mathrm{t}, J=$ $7.0 \mathrm{~Hz}, 3 \mathrm{H}), 2.84(\mathrm{t}, J=7.2 \mathrm{~Hz}, 2 \mathrm{H}), 2.98(\mathrm{~m}, 1 \mathrm{H}), 4.31(\mathrm{q}, J=7.0 \mathrm{~Hz}$, $2 \mathrm{H}), 7.47(\mathrm{~m}, 2 \mathrm{H}), 7.66(\mathrm{~m}, 2 \mathrm{H}), 8.28(\mathrm{~s}, 1 \mathrm{H}), 9.84(\mathrm{~s}, 1 \mathrm{H}),{ }^{13} \mathrm{C}$ NMR (100 MHz, [D $\left.\left.{ }_{6}\right] \mathrm{DMSO}\right): ~ \delta=18.9,19.7,39.1,52.6,53.3,65.3,76.8,88.4$, 113.2, 120.8, 122.9, 125.0, 134.1, 140.0, 144.7, 144.8, 154.0, 158.7, 162.8, 174.9.
b. The title compound $\mathbf{2 3 e}$ was synthesized from the above intermediate $(0.08 \mathrm{~g}, 0.23 \mathrm{mmol})$ and ethyl chlorooximinoacetate $(0.35 \mathrm{~g}, 2.32 \mathrm{mmol})$ according to General Procedure D and purified by preparative TLC (EtOAc - hexane; 20\%). Yield: $0.072 \mathrm{~g}(65 \%) .{ }^{1} \mathrm{H}$ NMR ( 400 MHz , $\left.\mathrm{CDCl}_{3}\right): \delta=1.41(\mathrm{t}, J=8.0 \mathrm{~Hz}, 3 \mathrm{H}), 2.65(\mathrm{t}, J=7.3 \mathrm{~Hz}, 2 \mathrm{H}), 3.10(\mathrm{t}, J=$ $7.3 \mathrm{~Hz}, 2 \mathrm{H}), 4.23(\mathrm{~m}, 2 \mathrm{H}), 4.44(\mathrm{q}, J=8.0 \mathrm{~Hz}, 2 \mathrm{H}), 6.33(\mathrm{~s}, 1 \mathrm{H}), 7.12(\mathrm{~m}$, 2H), $7.29(\mathrm{~m}, 2 \mathrm{H}), 7.43(\mathrm{~m}, 1 \mathrm{H}), 7.87(\mathrm{br} \mathrm{s}, 1 \mathrm{H}), 11.64(\mathrm{br} \mathrm{s}, 1 \mathrm{H}),{ }^{13} \mathrm{C}$ NMR ( $100 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ): $\delta=14.1,21.6,32.6,62.1,102.0,108.5,121.1$, $129.5,134.8,138.6,149.0,153.9,156.3,159.2,160.0,169.1,173.2$.
$N$-[3-[2-[3-[3-(N-Hydroxycarbamoyl)isoxazol-5-yl]propionylamino]thiazol-4yl]phenyl]carbamic Acid Ethyl Ester (5)—The title compound was synthesized from the ester $23 \mathrm{e}(0.072 \mathrm{~g}, 0.163 \mathrm{mmol})$ according to General Procedure E. Yield: 0.035 g $(50 \%) .{ }^{1} \mathrm{H}$ NMR ( $\left.400 \mathrm{MHz},\left[\mathrm{D}_{6}\right] \mathrm{DMSO}\right): \delta=1.30(\mathrm{t}, J=7.0 \mathrm{~Hz}, 3 \mathrm{H}), 2.95(\mathrm{t}, J=7.3 \mathrm{~Hz}$, $2 \mathrm{H}), 3.25(\mathrm{t}, J=7.3 \mathrm{~Hz}, 2 \mathrm{H}), 4.19(\mathrm{q}, J=7.0 \mathrm{~Hz}, 2 \mathrm{H}), 6.60(\mathrm{~s}, 1 \mathrm{H}), 7.28-7.32(\mathrm{~m}, 3 \mathrm{H}), 7.55$ (d, $J=7.0 \mathrm{~Hz}, 1 \mathrm{H}$ ), $8.07(\mathrm{~s}, 1 \mathrm{H}), 9.27(\mathrm{~s}, 1 \mathrm{H}) ;{ }^{13} \mathrm{C}$ NMR ( $100 \mathrm{MHz},\left[\mathrm{D}_{6}\right] \mathrm{DMSO}$ ): $\delta=14.9$, 21.9, 32.5, 60.6, 102.3, 108.5, 116.1, 118.2, 120.2, 129.4, 135.2, 140.0, 149.3, 153.9, 157.4, 158.0, 161.3, 170.1, 174.6; HPLC purity: $97.6 \%$; HRMS-FAB: $m / z[M+H]^{+}$calcd for $\mathrm{C}_{19} \mathrm{H}_{19} \mathrm{~N}_{5} \mathrm{O}_{6} \mathrm{~S}: 446.1128$, found: 446.1141.
$N$-[4-[3-( $N$-But-3-ynylcarbamoyl)isoxazol-5-yl]phenyl]carbamic Acid tert-Butyl
Ester (25a)-General Procedure C was used to couple the acid $\mathbf{2 4 a}(0.60 \mathrm{~g}, 1.97 \mathrm{mmol})$ )
and but-3-ynylamine hydrochloride $(0.22 \mathrm{~g}, 2.08$ mmol). The crude product was purified by
HPLC to afford acetylene $\mathbf{2 5 a}(0.126 \mathrm{~g}, 18 \%))^{1} \mathrm{H} N \mathrm{NM}\left(400 \mathrm{MHz}, \mathrm{CDCl}_{3}\right): \delta=1.45(\mathrm{~s}$,
$9 \mathrm{H}), 1.98(\mathrm{t}, J=2.6 \mathrm{~Hz}, 1 \mathrm{H}), 2.45(\mathrm{~m}, 2 \mathrm{H}), 3.55(\mathrm{~m}, 2 \mathrm{H}), 6.58(\mathrm{~s}, 1 \mathrm{H}), 6.79(\mathrm{~s}, 1 \mathrm{H}), 7.07(\mathrm{~m}$,
$1 \mathrm{H}), 7.18(\mathrm{~s}, 1 \mathrm{H}), 7.42(\mathrm{~d}, J=8.6 \mathrm{~Hz}, 2 \mathrm{H}), 7.63(\mathrm{~d}, J=8.6 \mathrm{~Hz}, 1 \mathrm{H}) ;{ }^{13} \mathrm{C} \mathrm{NMR}(100 \mathrm{MHz}$,
$\left.\mathrm{CDCl}_{3}\right): \delta=19.3,28.2,30.9,38.0,70.4,80.89,81.2,98.1,118.3,121.3,126.8,140.6,12.2$,
$158.9,159.0,171.4$.

## 5-[2-[[5-[4-(tert-Butoxycarbonylamino)phenyl]isoxazole-3-

 carbonyl]amino]ethyl]isoxazole-3-carboxylic Acid Ethyl Ester (26a)—The title compound was synthesized from the acetylene $\mathbf{2 5 a}(0.126 \mathrm{~g}, 0.36 \mathrm{mmol})$ and ethyl chlorooximinoacetate ( $1.00 \mathrm{~g}, 6.60 \mathrm{mmol}$ ) according to General Procedure D and purified by flash chromatography (EtOAc - hexane; 25\% to 70\%). Yield: $0.105 \mathrm{~g}(63 \%) .{ }^{1} \mathrm{H}$ NMR (400$\left.\mathrm{MHz}, \mathrm{CDCl}_{3}\right): \delta=1.34(\mathrm{t}, J=7.2 \mathrm{~Hz}, 3 \mathrm{H}), 1.47(\mathrm{~s}, 9 \mathrm{H}), 3.14(\mathrm{~m}, 2 \mathrm{H}), 3.75(\mathrm{t}, J=6.8 \mathrm{~Hz}$, $2 \mathrm{H}), 4.37(\mathrm{q}, J=7.2 \mathrm{~Hz}, 2 \mathrm{H}), 6.51(\mathrm{~s}, 1 \mathrm{H}), 6.80(\mathrm{~s}, 1 \mathrm{H}), 7.46(\mathrm{~d}, J=8.5 \mathrm{~Hz}, 2 \mathrm{H}), 7.63(\mathrm{~d}, J=$ $8.5 \mathrm{~Hz}, 2 \mathrm{H}) ;{ }^{13} \mathrm{C}$ NMR ( $100 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ): $\delta=13.9,26.7,28.1,37.1,62.1,97.8,102.5$, $118.3,120.7,126.7,141.1,152.7,156.4,158.6,159.6,159.9,171.5,172.1$.

## $N$-[4-[3-[ $N$-[2-[3-(N-Hydroxycarbamoyl)isoxazol-5-yl]ethyl]carbamoyl]isoxazol-5-yl]phenyl]carbamic Acid tert-Butyl Ester (6)-

 The title compound was synthesized from the ester $26 \mathbf{a}(0.105 \mathrm{~g}, 0.223 \mathrm{mmol})$ according to General Procedure E and purified by HPLC (Method A). Yield: $0.025 \mathrm{~g}(24.5 \%) .{ }^{1} \mathrm{H}$ NMR ( $\left.400 \mathrm{MHz},\left[\mathrm{D}_{6}\right] \mathrm{DMSO}\right): \delta=1.42(\mathrm{~s}, 9 \mathrm{H}), 3.04(\mathrm{~m}, 2 \mathrm{H}), 3.52(\mathrm{~m}, 2 \mathrm{H}), 6.58(\mathrm{~s}, 1 \mathrm{H}), 7.11(\mathrm{~s}$, $1 \mathrm{H}), 7.56(\mathrm{~d}, J=8.4 \mathrm{~Hz}, 2 \mathrm{H}), 7.65(\mathrm{~d}, J=8.4 \mathrm{~Hz}, 2 \mathrm{H}), 8.92(\mathrm{~m}, 1 \mathrm{H}), 9.28(\mathrm{br} \mathrm{s}, 1 \mathrm{H}), 9.63(\mathrm{~s}$, 1H), $11.4(\mathrm{~s}, 1 \mathrm{H}) ;{ }^{3} \mathrm{C}$ NMR (100 MHz, [D $\left.\left.{ }_{6}\right] \mathrm{DMSO}\right): ~ \delta=26.4,28.4,37.2,80.0,98.8,101.6$, $118.5,120.3,127.0,142.3,153.0,156.6,157.8,159.1,159.7,170.9,172.5 ;$ HPLC purity: $97.6 \%$; HRMS-FAB: $m / z[M+H]^{+}$calcd for $\mathrm{C}_{21} \mathrm{H}_{23} \mathrm{~N}_{5} \mathrm{O}_{7} \mathrm{~S}: 458.1670$, found: 458.1669.N-[3-[3-(N-But-3-ynylcarbamoyl)isoxazol-5-yl]phenyl]carbamic Acid tert-Butyl Ester (25b)-General Procedure C was used to couple the acid $\mathbf{2 4 b}$ ( $1.30 \mathrm{~g}, 4.30 \mathrm{mmol}$ ) and but-3-ynylamine hydrochloride $(0.50 \mathrm{~g}, 4.73 \mathrm{mmol})$. ## 4-[[[5-[4-[(tert-Butoxycarbonyl)amino]phenyl]isoxazole-3-

 carbonyl]amino]methyl]benzoic Acid Methyl Ester (29a)—To a solution of the acid 24a ( $0.50 \mathrm{~g}, 1.64 \mathrm{mmol}$ ) in DMF ( 3.0 mL ) was added PyBOP ( $0.94 \mathrm{~g}, 1.80 \mathrm{mmol}$ ), and the mixture was stirred for 15 min at ambient temperature. Methyl 4-(aminomethyl)benzoate hydrochloride ( $0.35 \mathrm{~g}, 2.16 \mathrm{mmol}$ ) and $\mathrm{Et}_{3} \mathrm{~N}(0.65 \mathrm{~mL}, 4.93 \mathrm{mmol})$ were added subsequently, and the mixture was heated in a microwave reactor for 20 min at $65^{\circ} \mathrm{C}$. Water $(20 \mathrm{~mL})$ was added, and the mixture was extracted with EtOAc ( 3 X 25 mL ). The combined organic phases were washed with brine ( 40 mL ), dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$, and evaporated. The residue was purified by flash chromatography (EtOAc - hexane; $40 \%$ to $100 \%$ ) to provide the ester 29a ( $0.60 \mathrm{~g}, 81 \%$ ). ${ }^{1} \mathrm{H}$ NMR ( $\left.400 \mathrm{MHz},\left[\mathrm{D}_{6}\right] \mathrm{DMSO}\right): ~ \delta=1.48(\mathrm{~s}, 9 \mathrm{H}), 4.01(\mathrm{~s}$, $3 \mathrm{H}), 4.54(\mathrm{~d}, J=6.0 \mathrm{~Hz}, 2 \mathrm{H}), 7.14(\mathrm{~s}, 1 \mathrm{H}), 7.45(\mathrm{~d}, J=8.1 \mathrm{~Hz}, 2 \mathrm{H}), 7.61(\mathrm{~d}, J=8.5 \mathrm{~Hz}, 2 \mathrm{H})$, 7.81 (d, $J=8.1 \mathrm{~Hz}, 2 \mathrm{H}), 7.95(\mathrm{~d}, J=8.6 \mathrm{~Hz}, 2 \mathrm{H}), 9.42(\mathrm{t}, J=6.0 \mathrm{~Hz}, 1 \mathrm{H}), 9.7(\mathrm{~s}, 1 \mathrm{H})$.
## N-[4-[3-[N-[4-(N-Hydroxycarbamoyl)benzyl]carbamoyl]isoxazol-5-

 yl]phenyl]carbamic Acid tert-Butyl Ester (13)—To a solution of the methyl ester 29a $(0.20 \mathrm{~g}, 0.44 \mathrm{mmol})$ and hydroxylamine hydrochloride $(0.18 \mathrm{~g}, 2.65 \mathrm{mmol})$ in a mixture of MeOH and THF $(2: 1,15 \mathrm{~mL})$ was added $\mathrm{MeONa}(0.81 \mathrm{~mL}, 3.54 \mathrm{mmol}$, as a $21 \%$ solution in MeOH ) at ambient temperature. The mixture was stirred overnight, and then 1 N hydrochloric acid was added to adjust the pH to approx. 4. The mixture was diluted with EtOAc ( 50 mL ), washed with brine ( 25 mL ), dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$, and concentrated under vacuum. The residue was purified by HPLC (Method A) to give the title compound. Yield: $0.02 \mathrm{~g}(10 \%) .{ }^{1} \mathrm{H}$ NMR ( $\left.400 \mathrm{MHz},\left[\mathrm{D}_{6}\right] \mathrm{DMSO}\right): ~ \delta=1.43(\mathrm{~s}, 9 \mathrm{H}), 4.43(\mathrm{~d}, J=5.9 \mathrm{~Hz}, 2 \mathrm{H})$, $7.15(\mathrm{~s}, 1 \mathrm{H}), 7.31(\mathrm{~d}, J=8.0 \mathrm{~Hz}, 2 \mathrm{H}), 7.55(\mathrm{~d}, J=8.6 \mathrm{~Hz}, 2 \mathrm{H}), 7.64(\mathrm{~d}, J=8.0 \mathrm{~Hz}, 2 \mathrm{H}), 7.75$(d, $J=8.6 \mathrm{~Hz}, 2 \mathrm{H}), 9.33(\mathrm{t}, J=5.9 \mathrm{~Hz}, 1 \mathrm{H}), 9.64(\mathrm{~s}, 1 \mathrm{H}), 11.11(\mathrm{~s}, 1 \mathrm{H}) ;{ }^{13} \mathrm{C}$ NMR ( 100
$\left.\mathrm{MHz},\left[\mathrm{D}_{6}\right] \mathrm{DMSO}\right): ~ \delta=28.1,30.7,42.1,79.7,98.5,99.5,118.2,120.0,126.6,127.0,127.2$, 131.5, 142.0, 142.2, 152.6, 158.8, 159.4, 164.1, 170.6; HPLC purity: 97.6\%; HRMS-FAB: $\mathrm{m} / \mathrm{z}[M-\mathrm{H}]^{-}$calcd for $\mathrm{C}_{23} \mathrm{H}_{24} \mathrm{~N}_{4} \mathrm{O}_{6}$ : 451.1623, found: 451.1639.

## 4-[[[5-[3-[(tert-Butoxycarbonyl)amino]phenyl]isoxazole-3-

 carbonyl]amino]methyl]benzoic Acid Methyl Ester (29b)—The title compound was synthesized from the acid $\mathbf{2 4 b}(1.00 \mathrm{~g}, 3.29 \mathrm{mmol})$, methyl 4-(aminomethyl)benzoate hydrochloride ( $0.54 \mathrm{~g}, 3.29 \mathrm{mmol}$ ), PyBOP ( $1.88 \mathrm{~g}, 3.62 \mathrm{mmol}$ ), and $\mathrm{N}, \mathrm{N}$ diisopropylethylamine ( $0.96 \mathrm{~mL}, 7.23 \mathrm{mmol}$ ) using the same procedure as for compound 29a. Yield: $0.77 \mathrm{~g}(50 \%) .{ }^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ): $\delta=1.48(\mathrm{~s}, 9 \mathrm{H}), 4.58(\mathrm{~d}, J=5.2 \mathrm{~Hz}$, $2 \mathrm{H}), 4.94(\mathrm{~s}, 1 \mathrm{H}), 6.93(\mathrm{~s}, 1 \mathrm{H}), 7.31-7.40(\mathrm{~m}, 10 \mathrm{H}), 7.61(\mathrm{~d}, J=6.3 \mathrm{~Hz}, 2 \mathrm{H}), 7.70(\mathrm{~m}, 1 \mathrm{H})$, $7.80(\mathrm{~s}, 1 \mathrm{H}), 7.95(\mathrm{~m}, 1 \mathrm{H})$.
## N-[3-[3-[N-[4-(N-Hydroxycarbamoyl)benzyl]carbamoyl]isoxazol-5-

 yl]phenyl]carbamic Acid tert-Butyl Ester (14)—The title compound was synthesized from the ester $\mathbf{2 9 b}(0.35 \mathrm{~g}, 0.78 \mathrm{mmol})$ using the same procedure as for compound $\mathbf{1 3}$. The crude product was purified by HPLC (Method A) to give the title compound ( 0.06 g , $17 \%) .{ }^{1} \mathrm{H}$ NMR ( $\left.400 \mathrm{MHz},\left[\mathrm{D}_{6}\right] \mathrm{DMSO}\right): ~ \delta=4.43(\mathrm{~d}, J=5.9 \mathrm{~Hz}, 2 \mathrm{H}), 7.21(\mathrm{~s}, 1 \mathrm{H}), 7.34(\mathrm{~m}$, $3 \mathrm{H}), 7.38(\mathrm{~m}, 2 \mathrm{H}), 7.66(\mathrm{~d}, J=8.1 \mathrm{~Hz}, 2 \mathrm{H}), 8.03(\mathrm{~s}, 1 \mathrm{H}), 9.38(\mathrm{t}, J=6.1 \mathrm{~Hz}, 1 \mathrm{H}), 9.55(\mathrm{~s}$, $1 \mathrm{H}), 11.12(\mathrm{~s}, 1 \mathrm{H}) ;{ }^{13} \mathrm{C}$ NMR (100 MHz, [D $\left.\left.\mathrm{D}_{6}\right] \mathrm{DMSO}\right): ~ \delta=28.5,42.5,79.9,100.2,114.9$, 120.2, 120.7, 127.0, 127.4, 127.6, 130.2, 131.9, 140.8, 142.5, 153.2, 159.0, 159.9, 164.5, 170.9; HPLC purity: 96.4\%; HRMS-FAB: $\mathrm{m} / \mathrm{z}[M+\mathrm{H}]^{+}$calcd for $\mathrm{C}_{23} \mathrm{H}_{24} \mathrm{~N}_{4} \mathrm{O}_{6}: 453.1774$, found: 453.1781.
## 4-[[[5-[3-[(Cyclohexanecarbonyl)amino]phenyl]isoxazole-3carbonyl]amino]methyl]benzoic Acid (31b)

a. Synthesis of 4-[[[5-(3-aminophenyl)isoxazole-3carbonyl]amino]methyl]benzoic acid methyl ester. A solution of tert-butyl carbamate $29 \mathbf{b}(0.76 \mathrm{~g}, 1.68 \mathrm{mmol})$ in 12 mL of a mixture of $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ and trifluoroacetic acid (1:1) was stirred overnight at ambient temperature. The solvents were evaporated, and the residue was recrystallized from EtOAchexane $(10 \%)$ to provide the intermediate amine $(0.50 \mathrm{~g})$ which was used directly in next step.
b. Synthesis of 4[[[5-[3-[(cyclohexanecarbonyl]amino]phenyl]isoxazole-3carbonyl]amino]methyl]benzoic acid methyl ester (30b). To a solution of the amine ( $0.50 \mathrm{~g}, 1.42 \mathrm{mmol}$ ) in 20 mL of a mixture of $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ and THF (1:1) were added $\mathrm{Et}_{3} \mathrm{~N}(0.37 \mathrm{~mL}, 2.84 \mathrm{mmol})$ and cyclohexanecarbonyl chloride ( $0.38 \mathrm{~mL}, 2.84 \mathrm{mmol}$ ) at ambient temperature. After 15 min , water ( 15 mL ) was added, and the mixture was extracted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ (3 X 25 mL ). The combined organic phases were washed with brine ( 40 mL ), dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$, and evaporated. The residue was purified by flash chromatography $\left(\mathrm{CH}_{2} \mathrm{Cl}_{2}-\mathrm{MeOH} ; 5 \%\right)$ to provide the acylation product $(0.54 \mathrm{~g}, 82 \%)$, which was used directly in next step.
c.

To a stirred solution of intermediate $\mathbf{3 0 b}(0.54 \mathrm{~g}, 1.17 \mathrm{mmol})$ in THF (20 mL ) was added a freshly prepared solution of $\mathrm{LiOH}(0.12 \mathrm{~g}, 4.28 \mathrm{mmol})$ in $\mathrm{H}_{2} \mathrm{O}(10 \mathrm{~mL})$ at ambient temperature. After $24 \mathrm{~h}, \mathrm{NaOH}(0.10 \mathrm{~g}, 2.1$ mmol ) was added. The mixture was stirred for 30 min , acidified with 1 N HCl to pH approx. 2, diluted with $\mathrm{EtOAc}(25 \mathrm{~mL})$, washed with $\mathrm{H}_{2} \mathrm{O}(15$ mL ) and brine ( 15 mL ), dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$, and concentrated under vacuum to provide the acid 31b $(0.26 \mathrm{~g}, 50 \%)$. ${ }^{1} \mathrm{H}$ NMR $(400 \mathrm{MHz}$, [ $\left.\left.\mathrm{D}_{6}\right] \mathrm{DMSO}\right): ~ \delta=1.25-2.33(\mathrm{~m}, 10 \mathrm{H}), 2.33(\mathrm{t}, J=11.0 \mathrm{~Hz}, 1 \mathrm{H}), 4.53(\mathrm{~d}, J$ $=5.7 \mathrm{~Hz}, 2 \mathrm{H}), 7.31(\mathrm{~s}, 1 \mathrm{H}), 7.37(\mathrm{~d}, J=8.0 \mathrm{~Hz}, 2 \mathrm{H}), 7.46(\mathrm{t}, J=7.9 \mathrm{~Hz}$, $1 \mathrm{H}), 7.61(\mathrm{~d}, J=7.9 \mathrm{~Hz}, 1 \mathrm{H}), 7.72(\mathrm{~d}, J=7.9 \mathrm{~Hz}, 1 \mathrm{H}), 7.90(\mathrm{~d}, J=8.0 \mathrm{~Hz}$, $2 \mathrm{H}), 8.28(\mathrm{~s}, 1 \mathrm{H}), 9.46(\mathrm{t}, J=6.0 \mathrm{~Hz}, 1 \mathrm{H}), 10.14(\mathrm{~s}, 1 \mathrm{H})$.

#### Abstract

5-[3-[(Cyclohexanecarbonyl)amino]phenyl]-N-[4-(N- hydroxycarbamoyl)benzyl]isoxazole-3-carboxamide (16)—To a solution of the acid 31b ( $0.12 \mathrm{~g}, 0.26 \mathrm{mmol}$ ) and $N$-methylmorpholine ( $0.032 \mathrm{~g}, 0.32 \mathrm{mmol}$ ) in THF ( 8 mL ) was added ethyl chloroformate $(0.030 \mathrm{~mL}, 0.32 \mathrm{mmol})$ at $0^{\circ} \mathrm{C}$, and the mixture was stirred for 30 min . The precipitate was filtered off, and the filtrate was added to a mixture of hydroxylamine hydrochloride ( $0.037 \mathrm{~g}, 0.53 \mathrm{mmol})$ and $\mathrm{Et}_{3} \mathrm{~N}(0.07 \mathrm{~mL}, 0.53 \mathrm{mmol})$ in DMF $(2 \mathrm{~mL})$. The reaction mixture was stirred for 30 min at $0^{\circ} \mathrm{C} .1 \mathrm{~N}$ Hydrochloric acid was added to bring the pH to approx. 4, and the mixture was extracted with EtOAc ( 3 X 25 mL ). The combined organic phases were washed with brine ( 40 mL ), dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$, and evaporated. The residue was purified by HPLC (Method B) to give the hydroxamic acid. Yield: $0.01 \mathrm{~g}(8 \%) .{ }^{1} \mathrm{H}$ NMR ( $\left.400 \mathrm{MHz},\left[\mathrm{D}_{6}\right] \mathrm{DMSO}\right): ~ \delta=1.18-1.84(\mathrm{~m}, 10 \mathrm{H}), 2.33(\mathrm{~m}$, $1 \mathrm{H}), 4.51$ (d, $J=6.0 \mathrm{~Hz}, 2 \mathrm{H}), 7.30(\mathrm{~s}, 1 \mathrm{H}), 7.36$ (d, $J=8.2 \mathrm{~Hz}, 2 \mathrm{H}), 7.47(\mathrm{t}, J=7.9 \mathrm{~Hz}, 1 \mathrm{H})$, $7.61(\mathrm{~d}, J=7.9 \mathrm{~Hz}, 1 \mathrm{H}), 7.71(\mathrm{~d}, J=7.9 \mathrm{~Hz}, 1 \mathrm{H}), 7.73(\mathrm{~d}, J=8.2 \mathrm{~Hz}, 2 \mathrm{H}), 8.26(\mathrm{~s}, 1 \mathrm{H}), 9.00$ (br s, 1 H ), $9.46(\mathrm{t}, J=6.0 \mathrm{~Hz}, 1 \mathrm{H}), 10.06(\mathrm{~s}, 1 \mathrm{H}), 11.18(\mathrm{~s}, 1 \mathrm{H}) ;{ }^{13} \mathrm{C}$ NMR $(100 \mathrm{MHz}$, [ $\mathrm{D}_{6}$ ]DMSO): $\delta=25.6,25.8,29.5,42.5,45.3,100.2,116.0,121.0,121.6,127.0,127.4$, 127.6, 130.2, 131.9, 140.7, 142.5, 159.0, 159.9, 164.5, 170.8, 175.1; HPLC purity: $97.2 \%$; HRMS-FAB: $m / z[M+H]^{+}$calcd for $\mathrm{C}_{25} \mathrm{H}_{26} \mathrm{~N}_{4} \mathrm{O}_{6}: 463.1976$, found: 463.1988 .

## 5-[4-[(Cyclohexanecarbonyl)amino]phenyl]-N-[4-(N-hydroxycarbamoyl)benzyl]isoxazole-3-carboxamide (15)

> a.
> Synthesis of 4-[[[5-[[3-[(cyclohexanecarbonyl)amino]phenyl]isoxazole-3carbonyl]amino]methyl]benzoic acid (31a). Intermediate 29a was subjected to the same three-step sequence as employed in the transformation of intermediate 29b to 31b. Compound 31a: 1 H NMR $\left(\left[\mathrm{D}_{6}\right] \mathrm{DMSO}\right): \delta=1.16-1.76(\mathrm{~m}, 10 \mathrm{H}), 2.28(\mathrm{t}, J=11.0 \mathrm{~Hz}, 1 \mathrm{H}), 4.47(\mathrm{~d}, J$ $=6.2 \mathrm{~Hz}, 2 \mathrm{H}), 7.17(\mathrm{~s}, 1 \mathrm{H}), 7.37(\mathrm{~d}, J=8.2 \mathrm{~Hz}, 2 \mathrm{H}), 7.72(\mathrm{~d}, J=8.8 \mathrm{~Hz}$, $2 \mathrm{H}), 7.80(\mathrm{~d}, J=8.8 \mathrm{~Hz}, 2 \mathrm{H}), 7.85(\mathrm{~d}, J=8.2 \mathrm{~Hz}, 2 \mathrm{H}), 9.35(\mathrm{t}, J=6.0 \mathrm{~Hz}$, $1 \mathrm{H}), 10.03(\mathrm{~s}, 1 \mathrm{H}), 12.79(\mathrm{br} \mathrm{s}, 1 \mathrm{H})$.
b. Compound $\mathbf{1 5}$ was obtained from the preceding intermediate in the same manner as described for the synthesis of compound $\mathbf{1 6}$ from its precursor 31b. ${ }^{1} \mathrm{H}$ NMR ( $\left.400 \mathrm{MHz},\left[\mathrm{D}_{6}\right] \mathrm{DMSO}\right): ~ \delta=1.11-1.76(\mathrm{~m}, 10 \mathrm{H}), 2.32(\mathrm{~m}$, $1 \mathrm{H}), 4.44$ (d, $J=6.0 \mathrm{~Hz}, 2 \mathrm{H}), 7.16$ (s, 1H), 7.33 (d, $J=8.1 \mathrm{~Hz}, 2 \mathrm{H}), 7.66$
(d, $J=8.1 \mathrm{~Hz}, 2 \mathrm{H}), 7.72$ (d, $J=8.6 \mathrm{~Hz}, 2 \mathrm{H}), 7.80(\mathrm{~d}, J=8.6 \mathrm{~Hz}, 2 \mathrm{H}), 8.94$
(br s, 1H), $9.35(\mathrm{t}, J=6.0 \mathrm{~Hz}, 1 \mathrm{H}), 10.05(\mathrm{~s}, 1 \mathrm{H}), 11.12(\mathrm{~s}, 1 \mathrm{H}) ;{ }^{13} \mathrm{C}$ NMR (100 MHz, [D $\left.\left.\mathrm{D}_{6}\right] \mathrm{DMSO}\right): ~ \delta=25.6,25.7,29.4,42.5,45.3,99.1,119.6$,
121.1, 127.0, 127.4, 127.5, 131.8, 142.1, 142.5, 159.1, 159.8, 164.5, 170.8, 175.2; HPLC purity: $95.3 \%$; HRMS-FAB: $m / z[M+H]^{+}$calcd for $\mathrm{C}_{25} \mathrm{H}_{26} \mathrm{~N}_{4} \mathrm{O}_{6}: 463.1976$, found: 463.1988.

## 5-(Carbazol-9-ylmethyl)isoxazole-3-carboxylic Acid Ethyl Ester (33)

a. Synthesis of 9-prop-2-ynyl-9H-carbazole.To a solution of carbazole (1.00 $\mathrm{g}, 6.00 \mathrm{mmol})$ in dry DMF ( 5 mL ) was added $\mathrm{NaH}(0.31 \mathrm{~g}, 7.8 \mathrm{mmol})$ as a $60 \%$ suspension in mineral oil at $0^{\circ} \mathrm{C}$. The mixture was stirred for 15 min , then propargyl bromide $(0.73 \mathrm{~mL}, 6.6 \mathrm{mmol})$ was added, and the reaction mixture was allowed to warm to ambient temperature. The reaction mixture was poured into ice-water, and the solution was extracted with EtOAc. The organic phase was washed with water and brine, dried over anhydrous $\mathrm{Na}_{2} \mathrm{SO}_{4}$, and concentrated under vacuum. The crude product was purified by combiflash chromatography (EtOAc - hexane; 5\% to $70 \%$ ) to give $0.72 \mathrm{~g}(58 \%)$ of the carbazole intermediate. ${ }^{1} \mathrm{H}$ NMR (300 $\left.\mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta=2.07(\mathrm{t}, J=0.4 \mathrm{~Hz}, 1 \mathrm{H}), 2.84(\mathrm{~m}, 2 \mathrm{H}), 3.43(\mathrm{~m}, 2 \mathrm{H})$, $7.41(\mathrm{t}, J=8.3 \mathrm{~Hz}, 2 \mathrm{H}), 7.50(\mathrm{t}, J=8.3 \mathrm{~Hz}, 2 \mathrm{H}), 8.02(\mathrm{~d}, J=8.3 \mathrm{~Hz}, 2 \mathrm{H})$, 8.26 (d, $J=8.3 \mathrm{~Hz}, 2 \mathrm{H})$.
b. To a solution of 9-prop-2-ynyl-9 $\quad$-carbazole $(0.72 \mathrm{~g}, 3.50 \mathrm{mmol})$ and $\mathrm{Et}_{3} \mathrm{~N}(9.8 \mathrm{~mL}, 70 \mathrm{mmol})$ in 20 mL of dry THF under an Ar atmosphere stirred at ambient temperature, was added dropwise over 24 h by syringe pump a solution of ethyl chlorooximinoacetate ( $5.32 \mathrm{~g}, 35.0 \mathrm{mmol}$ ) in 20 mL of THF. The reaction mixture was filtered and washed with EtOAc, and the filtrate was evaporated. The residue was purified by CombiFlash chromatography (EtOAc - hexane; $5 \%$ then $40 \%$ ) to provide a mixture of the ester $\mathbf{3 3}$ and the dimer formed from the reagent $(2.35 \mathrm{~g})$.

5-(Carbazol-9-ylmethyl)isoxazole-3-carbohydroxamic Acid (17)—To a stirred solution of the ester $33(0.33 \mathrm{~g}, 1.03 \mathrm{mmol})$ in 5 mL of THF was added at $0{ }^{\circ} \mathrm{C}$ a freshly prepared solution of $\mathrm{NH}_{2} \mathrm{OH}$. After 15 min , the reaction mixture was acidified with 1 N HCl ( $\mathrm{pH} \sim 4$ ) and diluted with EtOAc. The resulting mixture was washed with $\mathrm{H}_{2} \mathrm{O}$ and brine, and the organic phase was dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$ and evaporated. The solid residue was purified by HPLC (method A) to give the hydroxamic acid as an off-white solid $(0.150 \mathrm{~g}, 47 \%) .{ }^{1} \mathrm{H}$ NMR (400 MHz, [D $\left.\left.\mathrm{D}_{6}\right] \mathrm{DMSO}\right): ~ \delta=5.86(\mathrm{~s}, 2 \mathrm{H}), 6.60(\mathrm{~s}, 1 \mathrm{H}), 7.18(\mathrm{t}, J=7.5 \mathrm{~Hz}, 2 \mathrm{H}), 7.40$ (t, $J=7.5 \mathrm{~Hz}, 2 \mathrm{H}), 7.68(\mathrm{~d}, J=7.5 \mathrm{~Hz}, 2 \mathrm{H}), 8.09(\mathrm{~d}, J=7.5 \mathrm{~Hz}, 2 \mathrm{H}), 9.27(\mathrm{~s}, 1 \mathrm{H}), 11.36(\mathrm{~s}$, $1 \mathrm{H}) ;{ }^{13} \mathrm{C}$ NMR (100 MHz, [D $\left.\left.{ }_{6}\right] \mathrm{DMSO}\right): ~ \delta=37.7,102.2,109.5,119.6,120.4,122.4,126.0$, 139.7, 155.8, 157.4, 169.6; HRMS-FAB: $m / z[M+\mathrm{H}]^{+}$calcd for $\mathrm{C}_{17} \mathrm{H}_{13} \mathrm{~N}_{3} \mathrm{O}_{3}: 308.1029$, found: 308.1036 .

## 5-(9H-Carbazol-9-ylmethyl)-N-[4-(hydroxycarbamoyl)benzyl]isoxazole-3carboxamide (18)

a. Synthesis of 5-(9H-carbazol-9-ylmethyl)isoxazole-3-carboxylic acid. To a stirred solution of the ester $33(0.83 \mathrm{~g}, 2.58 \mathrm{mmol})$ in 5.0 mL of THF was added a freshly prepared solution of $\mathrm{LiOH}(0.124 \mathrm{~g}, 5.17 \mathrm{mmol})$ in 5.0 mL of $\mathrm{H}_{2} \mathrm{O}$ at ambient temperature. The mixture was stirred overnight, NaOH ( $0.103 \mathrm{~g}, 2.59 \mathrm{mmol}$ ) was added, and the reaction mixture was stirred for 30 min . The reaction mixture was acidified with $1 \mathrm{~N} \mathrm{HCl}(\mathrm{pH} \sim 4)$, diluted with EtOAc , and washed with $\mathrm{H}_{2} \mathrm{O}$ and brine. The organic phase was dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$ and evaporated to give the carboxylic acid as an off-white solid ( $0.63 \mathrm{~g}, 83 \%$ ).
b. Synthesis of 4-[[5-(9H-carbazol-9-ylmethyl)isoxazole-3carboxamido]methyl]benzoic acid methyl ester. To a solution of the carboxylic acid ( $0.33 \mathrm{~g}, 1.13 \mathrm{mmol}$ ) in DMF ( 3 mL ) was added PyBOP ( $0.64 \mathrm{~g}, 1.24 \mathrm{mmol}$ ), and the mixture was stirred for 15 min at ambient temperature. Methyl 4-(aminomethyl)benzoate hydrochloride ( $0.24 \mathrm{~g}, 1.5$ $\mathrm{mmol})$ and $\mathrm{Et}_{3} \mathrm{~N}(0.45 \mathrm{~mL}, 3.4 \mathrm{mmol})$ were added. The resulting mixture was heated in a microwave oven at $65^{\circ} \mathrm{C}$ for 20 min . Water was added, and the mixture was extracted with EtOAc . The combined organic phases were washed with NaCl , dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$, and evaporated. The residue was purified by CombiFlash chromatography (EtOAc - hexane; $40 \%$ then $100 \%$, ) to provide the ester intermediate ( $1.0 \mathrm{~g}, 66 \%$ ). ${ }^{1} \mathrm{H}$ NMR (400 $\left.\mathrm{MHz},\left[\mathrm{D}_{6}\right] \mathrm{DMSO}\right): \delta=3.81(\mathrm{~s}, 3 \mathrm{H}), 4.43(\mathrm{~d}, J=6.1 \mathrm{~Hz}, 2 \mathrm{H}), 5.94(\mathrm{~s}, 2 \mathrm{H})$, $6.65(\mathrm{~s}, 1 \mathrm{H}), 7.24(\mathrm{t}, J=7.4 \mathrm{~Hz}, 2 \mathrm{H}), 7.35(\mathrm{~d}, J=8.3 \mathrm{~Hz}, 2 \mathrm{H}), 7.48(\mathrm{t}, J=$ $7.4 \mathrm{~Hz}, 2 \mathrm{H}), 7.75(\mathrm{~d}, J=8.3 \mathrm{~Hz}, 2 \mathrm{H}), 7.88(\mathrm{t}, J=8.3 \mathrm{~Hz}, 2 \mathrm{H}), 8.16(\mathrm{~d}, J=$ $7.4 \mathrm{~Hz}, 2 \mathrm{H}), 9.31(\mathrm{t}, J=6.1 \mathrm{~Hz}, 2 \mathrm{H}), 11.7(\mathrm{~s}, 1 \mathrm{H}),{ }^{13} \mathrm{C}$ NMR ( 100 MHz , [ $\mathrm{D}_{6}$ ]DMSO): $\delta=28.2,43.1,77.0,77.9,99.5,126.8,127.1,128.3,128.9$, $130.7,136.0,144.0,155.8$. (c) To a solution of the methyl ester ( 0.33 g , $0.75 \mathrm{mmol})$ and hydroxylamine hydrochloride $(0.31 \mathrm{~g}, 4.5 \mathrm{mmol})$ in MeOH-THF ( $20 \mathrm{~mL}, 1: 1$ ) was added MeONa ( $1.3 \mathrm{~mL}, 6.0 \mathrm{mmol}$, as a $21 \%$ solution in MeOH ) at ambient temperature. The mixture was stirred at ambient temperature for 60 h , acidified with $1 \mathrm{~N} \mathrm{HCl}(\mathrm{pH} \sim 4)$, and extracted with EtOAc. The combined organic phases were washed with NaCl , dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$, and evaporated. The residue was purified by HPLC (method A) to give the hydroxamic acid as a white solid ( 0.022 g , $6.6 \%) .{ }^{1} \mathrm{H}$ NMR ( $\left.400 \mathrm{MHz},\left[\mathrm{D}_{6}\right] \mathrm{DMSO}\right): \delta=4.32(\mathrm{~d}, J=5.9 \mathrm{~Hz}, 2 \mathrm{H})$, $5.88(\mathrm{~s}, 2 \mathrm{H}), 7.18(\mathrm{~m}, 4 \mathrm{H}), 7.42(\mathrm{t}, J=7.2 \mathrm{~Hz}, 2 \mathrm{H}), 7.58(\mathrm{~d}, J=8.2 \mathrm{~Hz}$, $2 \mathrm{H}), 7.69(\mathrm{~d}, J=8.2 \mathrm{~Hz}, 2 \mathrm{H}), 8.10(\mathrm{~d}, J=7.2 \mathrm{~Hz}, 2 \mathrm{H}), 8.92(\mathrm{~s}, 1 \mathrm{H}), 9.21$ (t, $J=5.9 \mathrm{~Hz}, 1 \mathrm{H}), 11.07(\mathrm{~s}, 1 \mathrm{H}) ;{ }^{13} \mathrm{C}$ NMR (100 MHz, [D 6$\left.] \mathrm{DMSO}\right): ~ \delta=$ $37.8,42.0,102.4,109.5,119.6,120.4,122.5,126.0,126.9,127.1,131.4$, 139.7, 142.0, 158.3, 158.7, 164.1, 170.0; HRMS-FAB: $m / z[M+H]^{+}$calcd for $\mathrm{C}_{25} \mathrm{H}_{20} \mathrm{~N}_{4} \mathrm{O}_{4}: 441.1557$, found: 441.1577 .

HDAC Inhibition Assays-HDAC inhibition assays were performed by the Reaction Biology Corporation (Malvern, PA) using human, full-length recombinant HDAC1 and 6 isolated from a baculovirus expression system in Sf9 cells. An acetylated, fluorogenic peptide derived from residues 379382 of p 53 (RHKKAc) was used as the substrate in the assays. The reaction buffer contained 50 mM Tris- $\mathrm{HCl}(\mathrm{pH} 8.0), 137 \mathrm{mM} \mathrm{NaCl}, 2.7 \mathrm{mM}$ $\mathrm{KCl}, 1 \mathrm{mM} \mathrm{MgCl} 2,1 \mathrm{mg} / \mathrm{mL}$ BSA, and a final concentration of $1 \% \mathrm{DMSO}$. The enzyme was delivered into wells of the reaction plate, and compounds were delivered in $100 \%$ DMSO into the enzyme mixture by Acoustic Technology (Echo550; nanoliter range). The plates were spun down and preincubated for 510 min . The substrate was then delivered to all reaction wells to initiate the reaction, and the plates were incubated for 2 h at $30^{\circ} \mathrm{C}$. After incubation, developer and trichostatin A were added to quench the reaction and generate fluorescence. Then, kinetic measurements were taken for 1.5 h in 15 min intervals to ensure that development was complete. End-point readings were taken for analysis after the development reached a plateau. Dose response curves were generated, and the $\mathrm{IC}_{50}$ for each compound was extrapolated from the generated plots. (Ten-dose $\mathrm{IC}_{50}$ curves were generated using a three-fold serial dilution pattern starting with concentrations of $30 \mu \mathrm{M}$.) All $\mathrm{IC}_{50}$ determinations were done in duplicate, and the values reported herein are the average of both trials $\pm$ the standard deviation.

## Measurement of Cell Viability

Pancreatic cancer cell lines BXPC3 and L3.6pl were obtained from the American Type Culture Collection (ATCC, Manassas, VA). The relative number of viable cancer cells was determined 72 hours post-treatment by measuring the optical density using [3-(4,5-dimethylthiazol-2-yl)-5-(3-carboxymethoxyphenyl)-2-(4-sulfophenyl)-2H-tetrazolium, inner salt; MTS] cell proliferation assay kit (Promega, Madison, WI). $\mathrm{GI}_{50}$ values for each compound were calculated by non-linear regression model of the standard slope using GraphPad Prism 6.0 software.

Figure 1.
HDAC inhibitors induce apoptosis in pancreatic cancer cells. L3.6pl pancreatic cancer cells were treated with $10 \mu \mathrm{M}$ of compounds $\mathbf{1}, \mathbf{2}$, or $\mathbf{4}$ for 24 h as indicated. Cells were collected and processed for Hoechst staining (upper panel), and cell lysates were prepared for Western immunoblotting (lower panel). $50 \mu \mathrm{~g}$ of the proteins were separated by SDS-PAGE, transferred to PVDF membrane, and immunoblotted as indicated.

Figure 2.
Evaluation of the ability of novel HDAC6 inhibitors to induce tubulin acetylation and to arrest cancer cell migration. (A) PANC1 cells were treated with DMSO or a $1 \mu \mathrm{M}$ concentration of HDACIs for 24 h . Cells were harvested and lysed, and equivalent amounts of protein were loaded per lane and immunoblotted as indicated. (B) PANC1 cells were treated with the indicated HDACIs, and a scratch was made through a confluent layer of cells. Images of the cells were taken at 24 and 48 hours post wounding.

Scheme 1.
Reagents and conditions : (a) (i) EDCI, DMAP, DCM, or (ii) $\mathrm{POCl}_{3}$, pyridine; (b) Fe , $\mathrm{NH}_{4} \mathrm{Cl}, \mathrm{AcOH}, \mathrm{EtOH} / \mathrm{H}_{2} \mathrm{O}$; (c) ethyl chlorooximinoacetate, $\mathrm{Et}_{3} \mathrm{~N}$, THF; (d) $\mathrm{Boc}_{2} \mathrm{O}$, toluene, microwave, $120^{\circ} \mathrm{C}$; (e) $\mathrm{ClCO}_{2} \mathrm{Et}, \mathrm{Et}_{3} \mathrm{~N}$, THF; (f) $\mathrm{NH}_{2} \mathrm{OH} . \mathrm{HCl}, \mathrm{KOH}$.

## Scheme 2.

Reagents and conditions : (a) But-3-ynylamine hydrochloride, PyBOP, $\mathrm{Et}_{3} \mathrm{~N}$, DMF; (b) ethyl chlorooximinoacetate, $\mathrm{Et}_{3} \mathrm{~N}$, THF; (c) $\mathrm{CF}_{3} \mathrm{COOH}, \mathrm{CH}_{2} \mathrm{Cl}_{2}$; (d) pivaloyl chloride, $\mathrm{Et}_{3} \mathrm{~N}$, $\mathrm{CH}_{2} \mathrm{Cl}_{2}$; (e) cyclohexanecarbonyl chloride, $\mathrm{Et}_{3} \mathrm{~N}, \mathrm{CH}_{2} \mathrm{Cl}_{2}$; (f) benzoyl chloride, $\mathrm{Et}_{3} \mathrm{~N}$, $\mathrm{CH}_{2} \mathrm{Cl}_{2}$; (g) $\mathrm{NH}_{2} \mathrm{OH} \cdot \mathrm{HCl}, \mathrm{KOH}, \mathrm{THF} / \mathrm{MeOH}$.

Scheme 3.
Reagents and conditions: (a) methyl 4-(aminomethyl)benzoate hydrochloride, PyBOP, $\mathrm{Et}_{3} \mathrm{~N}$, DMF; (b) $\mathrm{CF}_{3} \mathrm{COOH}, \mathrm{CH}_{2} \mathrm{Cl}_{2}$; (c) cyclohexanecarbonyl chloride, $\mathrm{Et}_{3} \mathrm{~N}, \mathrm{CH}_{2} \mathrm{Cl}_{2}$; (d) $\mathrm{NH}_{2} \mathrm{OH} \cdot \mathrm{HCl}, \mathrm{KOH}, \mathrm{THF} / \mathrm{MeOH}$; (e) $\mathrm{LiOH} / \mathrm{NaOH}, \mathrm{THF}-\mathrm{H}_{2} \mathrm{O}$; (f) $\mathrm{ClCO}_{2} \mathrm{Et}, \mathrm{NH}_{2} \mathrm{OH}, N$ methylmorpholine; (g) 3-bromopropyne, NaH , DMF; (h) ethyl chlorooximinoacetate, $\mathrm{Et}_{3} \mathrm{~N}$, THF.

## Chart 1.

Selected HDACIs with significant antiproliferative effects on pancreatic tumor cells.

${ }^{a}$ Pancreatic cancer cell lines BXPC3 and L3.6pl were obtained from the American Type Culture Collection (ATCC, Manassas, VA). Relative number of viable cancer cells was determined 72 hours post-treatment by measuring the optical density (OD) using [3-(4,5-dimethylthiazol-2-yl)-5-(3-carboxymethoxyphenyl)-2-(4-sulfophenyl)-2H-tetrazolium, inner salt; MTS] cell proliferation assay kit (Promega, Madison, WI). The OD value was determined as a mean of 5 replicates per compound concentration in a 96 -well plate. The GI50 value for each compound was calculated using a non-linear regression model of the standard slope using GraphPad Prism 6.0 software. b Standard Error
