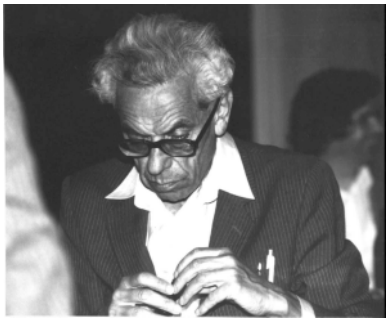
Preface

Paul Erdős liked to talk about The Book, in which God maintains the perfect proofs for mathematical theorems, following the dictum of G. H. Hardy that there is no permanent place for ugly mathematics. Erdős also said that you need not believe in God but, as a mathematician, you should believe in The Book. A few years ago, we suggested to him to write up a first (and very modest) approximation to The Book. He was enthusiastic about the idea and, characteristically, went to work immediately, filling page after page with his suggestions. Our book was supposed to appear in March 1998 as a present to Erdős' 85th birthday. With Paul's unfortunate death in the summer of 1996, he is not listed as a co-author. Instead this book is dedicated to his memory.



Paul Erdős

We have no definition or characterization of what constitutes a proof from The Book: all we offer here is the examples that we have selected, hoping that our readers will share our enthusiasm about brilliant ideas, clever insights and wonderful observations. We also hope that our readers will enjoy this despite the imperfections of our exposition. The selection is to a great extent influenced by Paul Erdős himself. A large number of the topics were suggested by him, and many of the proofs trace directly back to him, or were initiated by his supreme insight in asking the right question or in making the right conjecture. So to a large extent this book reflects the views of Paul Erdős as to what should be considered a proof from The Book.

"The Book"

A limiting factor for our selection of topics was that everything in this book is supposed to be accessible to readers whose backgrounds include only a modest amount of technique from undergraduate mathematics. A little linear algebra, some basic analysis and number theory, and a healthy dollop of elementary concepts and reasonings from discrete mathematics should be sufficient to understand and enjoy everything in this book.

We are extremely grateful to the many people who helped and supported us with this project — among them the students of a seminar where we discussed a preliminary version, to Benno Artmann, Stephan Brandt, Stefan Felsner, Eli Goodman, Torsten Heldmann, and Hans Mielke. We thank Margrit Barrett, Christian Bressler, Ewgenij Gawrilow, Michael Joswig, Elke Pose, and Jörg Rambau for their technical help in composing this book. We are in great debt to Tom Trotter who read the manuscript from first to last page, to Karl H. Hofmann for his wonderful drawings, and most of all to the late great Paul Erdős himself.

Berlin, March 1998 *Martin Aigner · Günter M. Ziegler*

Preface to the Fourth Edition

When we started this project almost fifteen years ago we could not possibly imagine what a wonderful and lasting response our book about The Book would have, with all the warm letters, interesting comments, new editions, and as of now thirteen translations. It is no exaggeration to say that it has become a part of our lives.

In addition to numerous improvements, partly suggested by our readers, the present fourth edition contains five new chapters: Two classics, the law of quadratic reciprocity and the fundamental theorem of algebra, two chapters on tiling problems and their intriguing solutions, and a highlight in graph theory, the chromatic number of Kneser graphs.

We thank everyone who helped and encouraged us over all these years: For the second edition this included Stephan Brandt, Christian Elsholtz, Jürgen Elstrodt, Daniel Grieser, Roger Heath-Brown, Lee L. Keener, Christian Lebœuf, Hanfried Lenz, Nicolas Puech, John Scholes, Bernulf Weißbach, and *many* others. The third edition benefitted especially from input by David Bevan, Anders Björner, Dietrich Braess, John Cosgrave, Hubert Kalf, Günter Pickert, Alistair Sinclair, and Herb Wilf. For the present edition, we are particularly grateful to contributions by France Dacar, Oliver Deiser, Anton Dochtermann, Michael Harbeck, Stefan Hougardy, Hendrik W. Lenstra, Günter Rote, Moritz Schmitt, and Carsten Schultz. Moreover, we thank Ruth Allewelt at Springer in Heidelberg as well as Christoph Eyrich, Torsten Heldmann, and Elke Pose in Berlin for their help and support throughout these years. And finally, this book would certainly not look the same without the original design suggested by Karl-Friedrich Koch, and the superb new drawings provided for each edition by Karl H. Hofmann.

Berlin, July 2009 *Martin Aigner · Günter M. Ziegler*

Table of Contents

Number Theory 1

1. Six proofs of the infinity of primes 3
2. Bertrand's postulate 7
3. Binomial coefficients are (almost) never powers 13
4. Representing numbers as sums of two squares 17
5. The law of quadratic reciprocity 23
6. Every finite division ring is a field 31
7. Some irrational numbers 35
8. Three times $\pi^2/6$ 43

Geometry 51

9. Hilbert's third problem: decomposing polyhedra 53
10. Lines in the plane and decompositions of graphs 63
11. The slope problem 69
12. Three applications of Euler's formula 75
13. Cauchy's rigidity theorem 81
14. Touching simplices 85
15. Every large point set has an obtuse angle 89
16. Borsuk's conjecture 95

Analysis 101

17. Sets, functions, and the continuum hypothesis 103
18. In praise of inequalities 119
19. The fundamental theorem of algebra 127
20. One square and an odd number of triangles 131

21. A theorem of Pólya on polynomials 139
22. On a lemma of Littlewood and Offord 145
23. Cotangent and the Herglotz trick 149
24. Buffon's needle problem 155

Combinatorics 159

25. Pigeon-hole and double counting 161
26. Tiling rectangles 173
27. Three famous theorems on finite sets 179
28. Shuffling cards 185
29. Lattice paths and determinants 195
30. Cayley's formula for the number of trees 201
31. Identities versus bijections 207
32. Completing Latin squares 213

Graph Theory 219

33. The Dinitz problem 221
34. Five-coloring plane graphs 227
35. How to guard a museum 231
36. Turán's graph theorem 235
37. Communicating without errors 241
38. The chromatic number of Kneser graphs 251
39. Of friends and politicians 257
40. Probability makes counting (sometimes) easy 261
